Well, I for one think this is a great idea -- but getting permission
might be difficult.

Antic (and ST spinoff STart) already has their own website up for
their magazine issues, for example (www.atarimagazines.com) and
feature full issue content (articles only) and type-in programs ready
for download. There is also a fledgeling A.N.A.L.O.G. archive in the
works, too, though it has few issues, most of which are incomplete and

many are poorly scanned.

If you can manage to pull this off however I think it'd be great! I'd particularily love to see all the classic Compute! issues.

Hey... while we're on the subject, are there any Atari pages out there that feature scanned/OCRed books on Atari? I bought quite a few way back, from the utterly-essential Mapping the Atari, to other programming books on graphics, gaming, etc. That'd be quite cool to see again.

Ditto. Saw them on sale in Montrï¿½al and at a local Atari show at
Rosemont College, around 1990.

Then again, as I remember it, the president of Atari Canada was
from a non-technological background and was the one that pushed
Atari into making clones, to help the Atari name get credibility
in the business world.

1789. Exile tribute site

Newsgroup: comp.sys.atari.st
Date: 2000-08-12 00:00:00 UTC
From: Andrew Weston <aweston.remove@redhotant.com>
Message-ID: <ant1218450b0#den@redhotant.com>
Source record: 58472

Dear All,

I maintain a tribute site for the classic 8-bit BBC Micro game
'Exile' and its later conversions onto the AtariST and Amiga. I have
recently written to the Amiga games newsgroup and I was wondering if
anybody would be kind enough to provide me with any screenshots or
additional information relating to the Atari ST conversion.
I understand the 16-bit versions were very similar. I don't know much at
all about the Atari hardware I'm afraid but I assume the game was
written to run on both 16-bit platforms?
As I have said on the Amiga newsgroup, any help would be appreciated as
it would allow me to more accurately reflect on the site the impact the
game had on the Atari platform.

Regards,

Andrew Weston

on Sat 12-08-2000 01:47 John N Oakes wrote:

>Hello All.
>As a Draconis user it's true that some of the sites can be troublesome.
>So I just deselect Javscript setting.

With other words Javascript is permantly desactivated. There is hardly one script Adamas accepts. Even very basic javascripts are able to make Adamas going nuts.
Sure you can deselect the javascript option but what is the use of it then.
I can accept such bugs from a beta version but not from a commercial product. I already have paid for three updates and with every update I get things are going worser. I once told the programmer about some bugs and all I got back from him was that he hadn't a Hades so he couldn't check it. Nice answer.

Yesterday, I told you about the cache problem I had. This was my fault. I was using the default value of 2.5 MB. I've set it to 10 MB now and it seems the cache problems are gone.

But I found another very naughty problem. Yesterday I was browsing around at http://www.fishbase.org. I tried to use the search option. All of the sudden Adamas stopped the retrievement of data. And that what that. At such moments Adamas really blocks the whole system. There is nothing one can do. The only way to get out of this impasse is a reset.

>Java is mainly for the implemation of sound and vision on web pages.

Java isn't supported by Adamas, only javascript which is something different.

>the problem for Atari straight away. Most of the time, i visit a site and it works fine
>then I keep it in a created folder Then try with the WenSuite3 to see if it work aswell.

As browser Wensuite is a much better product then Adamas. It doesn't crash very often and if it does WS doesn't take the system with it.

>True I have luck most of the times in both worlds, when it comes to emails ftp and
>good well maintained sites Draconis wins hands down. But with access and ease to
>newsgroups plus in built email and web browsing, WenSuite3 is a lot easier to use.

I wonder if you ever has used Okami, ASH-mailer, fiffi or Aftp? They are much better products then the Draconis clients and WS clients.

WS is indeed easy to use but I do know lots of non-French people who are unable to make a connection to their ISP. I for instance have for the moment three different ISP's. Only one can be used with WS.

I've asked the programmer of WS several times for a Wensuite to MiNT-net gateway which could solve lots of dialing problems. He always replied with: "coming soon". It seems he has another definition of coming soon then I've. It's almost a year later and still no sign of a WS to MiNT-net gateway.

A positive note to end this message. A few days ago OXO has announced in fr.comp.sys.fr that they are thinking to release WS as "Opensource".

Message-ID: <8n4g2h$c80$1@news.minx.net.uk>
Source record: 58476

Hi folks

I'm encountering a problem and I wonder if anyone here may be able to advise me? I've been logging-on fine with my present provider but have recently taken British Telecom up on their new SurfTime offer and even opened a secondary account with them.

At present I'm connecting to Freedomnames (my main provider) on my STE 1040 2 meg no problem via STing 1.15 but have had trouble getting DIAL.SCR and DEFAULT.CFG files together for BT Internet. I've tried adapting my Fnames ones with the relevant new info for BT, but while it logs-on ok, the initialisation bit fails and the modem hangs up. Is anyone here with BT Internet who may have a compatible script for them or know where I can find one? I'd be very grateful for any info.

Cheers :)

Yes, I thought so. Well could you tell us the name of it and does it
have any software? Does it work with the Falcon and what can it do?

Ahh.. the Expose. I have 2 of 'em myself. One of my cards is bad though.
But the good one does do good color video and still grabs.
I had to do a modification to get it working.

I wouldn't mind buying another Expose working or not.
And the lastest graphics card for the Falcon if it's available.
But it seems that alot of folks from the US have problems getting
anything from Titan/Core. It seems that the US Atari dealers are having
problems getting stuff as well, so I've heard.

Is there anyone in the UK that is an Atari Buff and can walk right into
Titan/Core and let me know for sure if any Expose's are for sale?

I'd like to find someone that I can trust in the UK that could purchase
Atari Items for me from Titan/Core. And any other UK atari dealers.

Anyone else with VideoGenlock info or one for sale do let me know.

I have heard something like this before, but there doesn't seem to be
much info around about this. Is there special Genlock software for the
Falcon to do this? If so anyone know the name(s) of the software or any
source of info about Falcon Genlocking.

I think Apex uses a hardware Genlock, not sure if any will do or if the
one made by Titan is required.

I am interested in a network card for my MEGA STE.
Don't you know, is this offer still valid?
Who is Axel and how to reach him?

From: stevenicx@home.com
Message-ID: <3996ee47.3718420@news>
Source record: 58399

The last of my Atari stuff is heading out due to lack of room.

This is a USA 4-meg STe, SM124 monitor (Magnavox colour monitor also available), external floppy, Spectre GCR w/ROMs, two hard drives (one 85-meg and one 110-meg). Might even be some software (avant vektor comes to mind) that would fit into the box. Shipping costs will probably be pretty high owing to the monitors.

Only known problem: serial port does not work and I don't wish to invest any $$$ into finding out why.

If interested, e-mail to stevenic@home.com

I don't know, but I have two of these cards and they're useless to me. Apparently the driver
only works on Mega STE and not TT, something Axel Gehringer didn't tell me... If I can't get a
refund I'll consider selling them, please contact me if you're interested.

I'm not 100% sure on this (I don't use BTi), but I have a vague
recollection that BTi use CHAP, which STinG doesn't support. MiNTnet
probably does, though.

Worth checking with BTi to see before you spend hours fiddling with
scripts to no avail.

IIRC SOME scanners would work on the Falcon if you switched the 68030 cache off
(via an NVRAM utility??), so that might be an avenue worth persuing.

>Also, need a good Hand Scanner Scanning Tray and MiGraphs MERGE IT software.

I strongly recommend going the flatbed scanner route. It's very har to stitch
scans together as you'll find that speed variations in the scanning process will
"stretch" one scan more than the other.

GTLook in English is available for download from my website BTW.

My first question is why on earth would you want to do this?

Secondly, I doubt this can easily be done as you will some way of networking
the emulated atari to windows, and as yet Winston doesn't support anything
like that (yet).

Also, can't you use the windows telnet program??

>Charles.

At the moment all my Atari's are living in boxes due to my move, so I
can't test them to check.

Certainly TOS versions 1.09, 1.02, 1.04, 1.06 & 1.62 have no help for
the help key!

I do know the Falcon (tos 4) does have help.

As soon as I've got an Atari up and running, I'll be able to check on
TOS 2.06!

Unfortunately the HELP key didn't help. I have two 1040 STFM's (TOS 1.04), one 1040 STF (TOS 1.00) and one Atari mouse.

I love these machines! They boot in 5 seconds and are more than powerful enough for me to do MIDI editing/recording, writing stories, and editing HTML. I prefer to use them over my PC (which is gathering dust).

It's just a little ackward without a mouse and would be nice if I could switch from one window to another using the keyboard.

Thanks for the suggestions, guys!

Richard,

I had the same problem with my Realtime Clock cart for my 1040ST. I set the time and date for 11:59pm December 31, 1999 and waited. Then it rolled over to 2000 and I adjusted the day and month. I also had to get a new battery from Radio Shack.

Hope this help,

Trenchcoat Steve

It's not a matter of being able to use windows programs to do it, it's a
matter of wanting to see what the ST programs look like and the challenge
of seeing it can be done.

As for the copyright it will still be a violation of law. The
publishers may not care but I wouldn't count on it.

> As always if a mag is on our site and
> the publisher, if there still around, wishes it not be there we will
> take it down, but hope they consider this project worthwhile and let
> us keep them there.

You should really try to get the permissions first. I (or rather the
admin of atari-computer.de) got permissions from three publishers
(sorry, only German ones) who were all quite cooperative. It's not that
hard although some mags gave the rights for their articles back to the
authors (like the German mag "Data Welt"). In this case you would have
to contact each author and get their permission.

> I believe this will be a great resource for everyone to be able to get
> a hold of some mags that are gone, but not forgotten.

Sure - although I don't like the PDF format but that's my personal
opinion :-)

Greetings,
Matthias.

>
>It's just a little ackward without a mouse and would be nice if I could
>switch from one window to another using the keyboard.
>
>Thanks for the suggestions, guys!

Hi

Anything you can do on a mouse you can do with the keyboard, to some
extent, although a little awkward.

Just to recap the arrow keys+ALTERNATIVE are directions for the cursor
to go, this moves the cursor quickly butnot accurately.

INSERT+ALTERNATIVE= LEFT mouse button, CLR/HOME+ALTERNATIVE = RIGHT
mouse button.

Pressing SHIFT key with the other keys moves the cursor slowly and more
accurately.

When you have a window open and is selected, ESC refreshes that window.
Always wise to do after a disk change, to be on the safe side.

If you have 2 or more windows open on the desktop, you can select a
file, or operation on any VISIBLE portion of an UNSELECTED window by
pressing and holding the RIGHT mouse button and using the LEFT buton as
normal.

Using this you can open directories. One neat feature is that you can
run a program with the ACTIVE directory being the window that's
selected.

To close a doc/program/inf/rsc file that you are viewing via the
desktop, press control+C.

Now TOS 1.4+ have some neat shortcuts introduced, which the STE's built
upon.

I can remember reading in the Rainbow TOS (1.04) blue sheet/card, that
HELP and UNDO does the same as LEFT and RIGHT mouse buttons when viewing

a document via the desktop! One button allows you to page down a screen, and the other returns you to the desktop; and for the life of me I can't remember which is which!!! I hate it when that happens:)

These are a few keyboard commands that spring to mind, and I use regularly when I need to.

Newer TOS version have more keyboard additions, including CREATE FOLDER, INFO...

There are also programs that allow you to have a custom key sequence (hotkey), by tapping into the print screen interrupt (Alt+help, IIRC).

It's a pity Atari never worked out how to write manuals or make functions more openly known. We may have had just ONE place to find out about shortcuts instead of stumbling across them!

Maybe it may be worth putting a list together with shortcuts/keyboard commands!

Message-ID: <39984b6d$0$18633@news.zetnet.co.uk>
Source record: 58425

I'm sorry that I don't have the original title of this thread - I have cleared out all past mail. However, I was looking over the RioRed website (the RioRed uses one or two CPU daughtercards. Each daughtercard contains one PowerPC G3cx microprocessor operating at a speed of 550 MHz) and came across the following:

RIORED is intended to be used with PPC LINUX. We have contacts with software companies involved in the Linux world. However, virtually any operating system can be used on this hardware platform (QNX, FreeBSD, NetBSD, BeOS, or even AmigaOS and MinT!). We want to help any people who wants to adapt an operating system on this computer. If you want info about software, please contact us: schembri@imaginet.fr

Would this mean that TOS could be adapted to run on it?

1843. Atari emulation of a PC...?

Newsgroup: comp.sys.atari.st

I have with sad regret decided to use a PC(since I was given one for free!), I haven't yet had the heart to clear out all my Atari stuff which has been a large part of my life for many years, I was wondering, is there a Atari emulator for the PC(Win 95 set-up)? I do miss programmes like Oasis which enabled you to read/write email and news messages off-line, though someday I will finally work out Outlook Express! I will still be a active reader of C.S.A.S, where so many people have helped me with my set-up over the years, the PC community don't seem to be the same somehow.

James

PS what is the IRC Atari channel nowadays, its been a while since I last used it and there is only a bot on it.

Hi,

I'd like to buy a ACSI to SCSI adaptator, in order to:
- use my Jaz drive with my ST
- share the SCSI chain with a PC

I can buy a Toplink interface, but should I rather buy a Link 97 ? Is
the Toplink ICD compatible, does it support parity ?
Do I need some extra power supply if I use the Toplink or Link97
interfaces, as for the Link 2 interface ?

Many questions, I'm a little bit lost, please help :)

thanks.

Simon.

Go to emulators.com and download version 7.2 of gemulator. Set up can be
tricky. It does not like certain programs. I turn off realplayer when I
run it. It is not perfect and can crash at inopportune times but it is
very very fast. I get about 8.5 times an STE on a P166 laptop. It will
support screen sizes that the Atari never would but many programs will
not work in these modes.

Hi James,

You can try TOSBOX. It's at version 1.10 now. It can emulate a 14 meg Atari with TOS 2.06 (It can also be configured to emulate lower RAM settings. ie: 4 megs. You can use ANY version of TOS (upto 2.06). TOS ROMs are in a file format now that can be found on the internet. TOSBOX will work in a pure DOS environment or even Win95/98

The URL is:
http://www.emuclassics.com/tosbox/

There are other Atari emulators as well designed for specific tasks. ie: gaming.

Hope this helps.

g'day

It's unfortunate that all the text strings are compiled into the binary!

I don't know yet if there are any differences in the various menu options
etc, so perhaps it might not be too difficult for Reiner to compile an
English version (or better still, devolve all the dialog boxes, menu items
and so on to a seperate RSC file).

Assuming Winston is capable of running STinG properly you could perhaps use a card with additional serial ports and a null-modem cable. You would also need to setup ip masking capable of using serial ports in pc mode.

With some versions of STinG it's perfectly possible to go online using Gemulator. I do this sometimes but use a TT (with modem) as masking computer.

I suggest instead you get an account with IC24. This doesn't cost you
anything to join up (although you need to use a PC or similar to sign up
on their website - Secure Server required).

Then you get freephone access between 9am and 5pm weekends, and until
October the 31st, on weekday nights between 8pm and midnight! All other
times it's local access (0845 number).

Via a PC you can signup at http://www.ic24.net or grab one of their CD's
that can be found at BP garages (I think) and other places.

I can report that it works very well on my Falcon (under STinG v1.26). BTW
you can get STinG v1.26 from my website http://jfhaslam.atari.org - this
may help with the BT account perhaps?

There is one thing that doesn't work on IC24 - Usenet News. Their server
is also secure for this (I'm told) and Newsie doesn't like it.

Cheers!

James

That is very a misinformed interpretation of copyright law. There
are certain provisions for using portions copyrighted material for what
is called "fair use," -- but fair use does not allow you to reproduce
entire magazines filled with copyrighted material. Even for
"educational" purposes.

The latest version of Winston supports the rs232 serial port. I have
tried to run sting in the emulator as well as cab, but get errors which
mostly relate to the way the emulator handles hard disk disk access.
There is a new version of Winston coming through the pipeline which will
sipport even more features. Take a look see at the LGD

Ok gang, I have an Atari Lynx for trade. I have two of these wonderful little machines, but have only one set of hands. So, I have decided to offer one up for trade. I am interested in an NEC TurboDuo in good condition. Or, if no one has one of those for trade, I would be interested in an Atari 7800. If interested, e-mail me direct please.

The Lynx is in great condition and still in the box. In light of the condition of the Lynx, I am only interested in systems in like condition. I do not want anyones junk please. The Lynx comes with the following games:

No box or manual unless noted.
Lynx still in box. Box is like new also.
Xybots
Bill & Ted (w/instructions)
Hydra (w/manual)
Batman Returns
Crystal Mines II (w/manual)
Steel Talons

1870. Released new winframe for Magic6.x

Hi!

Now we have released the first version of our winframe that was
mentioned earlier in this newsgroup. So go to our homepage at
nature.atari.org and go to the Projects page if you want to read about
it, or go to the Download page if you already know what this is all
about and just want to download it.

I'd like to point out that this is not just another winframe where we
have changed the icons, but a whole new one, which uses textures
instead of the old grey colours. A designer will be available later, but
for know you'll have to do with the one theme we have created for you.

TOS2WIN has MIDI capabilities, but correctly emulating a MIDI port (and the
required high-res timers) is not easy, so it might not work with every MIDI
program. However, I remember that TOS2WIN was successfully used with
multiple sequencer programs.

news:8n9j1qvo1@plutonium.btinternet.com...

: I was wondering, is there a Atari emulator for the PC(Win 95
: set-up)?

Better use the W98SE (Second Edition) as oS, it's bugfixed, has
more drivers, etc. It has no disadvantages towards the W95.
There's also the Windows ME (Millenium Edition), which is an
even more enhanced W98. The Atari emulators all use many parts
of the Windows OS, so you'd want as good a foundation as
possible.

If your MIDI software is not too ressource-hungry, you should be able to
test that with the demo version (which is limited in memory).

>Not an issue with Falcon, TT etc
>
>Mark Bedingfield

Aha! Now I know what you mean by power:)

There is another easy way around this, as I have come across a couple of
devices like this myself. One of my Pioneer CD changers doesn't supply
power and so I run this with an external SCSI device that does.

So if you have an ICD LINK II and use this with a hard drive, you should
be able to add the ZIP drive with NO ill effects. The problem will be if
the ZIP drive is alone on the SCSI chain.

I used to use the 680x0 version with a Powerbook 165 a number of years back.
I was very impressed with it then and it's moved on quite a bit since then.
Any GEM based application will run at a phenomenal speed on today's systems,
faster in many cases than native Mac or PC software.

Fair use allows many things as long as the intent is not profiteering.
While archiving the latest issue of Time would not be covered, a 10 year
old magazine can easily bo copied and archived for educational purposes,
providing there is no profiteering and the entire work is no available
as a complete download for personal use.

I am not a lawyer, but I do run a business and have to knwo at tleast a
little bit about these things.

Hang on a minute. I've just remembered something. I'm sure someone was
making a card for the PC which included the TOS ROM, MIDI in and out and a
cartridge slot (for dongles). I can't remember who or what software it is so
maybe someone else can help refresh my memory.

In case you haven't noticed I don't post much to CSS these days. Besides I've been an Atari fanatic for years. I got my first ST (a 520FM with single sided floppy) in 1987 and kept on using STs until 1994. My coolest ST was a Mega 1, upgraded to 4 megs, with a 40MB hard disk, MultiSync monitor, HD disk controller, Overscan module, 16Mhz 68000, blitter and TOS 1.4. I never did as much programming for it as I did for the Spectrum, but I wrote a fairly good CLI in STOS, a couple of demos, and did lots of artwork. Most of the stuff I know about computer art I learned on an ST using first NeoChrome and then Dega's Elite. I used to anti-alias by hand before I knew what the technique was called. One of my works of art even appeared on one of the Automantion disks (not that I condone piracy). And if you miss my contributions to CSS you'll find me on AFP and the Amstrad group quite a but these days even though I know next to nothing about either.

Might be some problem with direct hardware accesses - I would say bad luck,
since there is practically no further development done on TOS2WIN. Earlier,
I would have told you to mail the program to the TOS2WIN author ...

Speaking of whom, I emailed Nima with regards to upgrading my old, first rev of ScanX, but haven't gotten a reply. Is he off in Europe somewhere? My son picked up an Microtek II 300 dpi scanner for $5.00 at the thrift store, but the software doesn't recognize it.

1902. Success with PD drive on Falcon !!

Newsgroup: comp.sys.atari.st
Date: 2000-08-16 00:00:00 UTC
From: chrisc@zetnet.co.uk
Message-ID: <399af787$0$18634@news.zetnet.co.uk>
Source record: 58388

Hi folks...

Where do I register Spin? With whom and for how much?...I've cracked getting the PD drive to work on the Falcon....bit of a ritual but anyway....

PD unit I'm using is a Panasonic LF-1000 external unit (and you can't take the drive from the case and mount it internally, which is a bit poo but anyway)

The set up I've got is a recased Falcon with Nemesis and an Eclipse graphics card (4Mb) with 170/1Gb/2Gb drives and a CDROM all on the SCSI (and now of course the PD externally). OS is TOS4.04.
Usual setup is FVDI, HSMODEM (where do I register that these days?), X-Control, JPEG-DSP, STING and Metados.

To get the PD-Drive to work both ways you need to use the SPIN_SD.BOS in place of the normal Metados .BOS file, I use the Hard&Soft .DOS driver, but I expect that that ius ireelevant.

The PD drive needs to have the switch marked <LUN> set to <ON> and you need to have a PD disk in the drive when you boot.

The PD is now appearing as drive K: for the PD and drive O: for the CDROM.

Even more good news...

In an idle moment I changed my old IBM CDROM drive's driver set over to SPIN and it's started to work properly again....it's only been of use as a CD Audio drive for a long time (part of the reason I got the PD in the first place) , bnut now it's chiming itn as Drive P: quite happily...I'm very very impressed

There are limitations which might apply. If the mags were placed online
for educational purposes or for reference purposes and proper copyright
credit was given, there is nothing the publisher can do.

I know MagicMac can do it. The PC version may well be able to. It's
commerical software from Application Systems Heidelburg and a search engine
will probably turn up a link.

From: Mark Bedingfield <mark@baypc.com.au>
Message-ID: <e0om5.58$pT2.4437@nsw.nnrp.telstra.net>
Source record: 58366

The ICD draws it's power from the term power line that the HDD provides. In order to keep it simple and cheap, iomega omitted this line, so the ICD adaptor gets no power. This is only a concern on the external controllers. Not an issue with Falcon, TT etc

Mark Bedingfield

Hi Galen,

First thing I tried last weekend was NVDI upgrade from 5.02 to 5.03.
This should have made the 400 printing faster but it made it slower
instead. Now it too needs 10 minutes for an A4 picture :(
Afterwards I tried the 760 using NVDIs 740 driver and nothing at
all happened. With not much hope I bought a special 1482 cable and
connected that instead of the old parallel cable and to my surprise
it really worked. Printing is possible up to 1440x720 dpi :)
Then I tried printing a text file of approximately 1500 lines by
doubleclick/print and the Atari was ready for other tasks after
two seconds while the printer (256k printer buffer !) kept
printing for some minutes at about 4-5 pages/minute.

It's made by Application Systems Heidelburg. The UK distributor is System Solutions. They both have websites which I can't remeber the addresses of. I think Toad is the US distributor. It does not emulate an ST, it is a GEM compatible operating system that will run GEM programs written for the ST, TT, and Falcon 030. Using NVDI it can support Calamus, TrueType, Bitstream and PostScript fonts. It doesn't use Atari ROMs. It has true pre-emptive multi-tasking. It is incredibly fast. It can use the full graphic capabilities of the host machine. On the Mac it is possible to use MIDI software via serial MIDI ports. I don't know if this is supported on the iMac. It can read Atari formatted disks. It is possible to share files between the host computer and Magic. It will not run most games files. It is very stable and reliable. Any questions?

You cannot use a VGA monitor with an Atari ST. If you can get a multi-synch
that is your best bet since then you can view all three modes on one
monitor.

> Is there a converter available?
There is an RGB to VGA converter available but it is only sold to companies
(not individuals) and it is not cheap.

I don't have an URL, but the "schematics" is easy enough:

VGA ST

HSync to HSync
VSync to VSync
R,G,B to mono video input
Gnd to Gnd

And finally, connect the mono detect pin on the ST-side to ground.

The pin-out for both ports is available on the Hardware Book, and in the
manuals for your ST and monitor. The odd 13-pin DIN connector can be
ordered from ELFA (which I believe is big in Finland too).

I did. I stand by my statement. You cannot use a VGA monitor with an ST. I accept that you can use an SVGA monitor as a mono monitor but that's not what I was talking about. I still recommend a multi-sync.

I don't beleive it does direct hardware access. Its written in "C" and just
does async I/O to
the MIDI ports. I guess that they are XBIOS calls. Its a long time since I
wrote it....
Any way current strategy is to us PC program to get SYSEX dumps from MIDI
and the edit
these in the ATARI program..........

You don't need a SVGA, VGA will do just fine. Even though you can't use
low- and med-rez, you still can use a VGA-monitor on a ST.

Well, if you say so. I've only seen connections for SVGA and I didn't think
the VGA frequency went low enough.

Better to get a second-hand multisync then.

FamilyNet HQ: Telnet:\\www.family-bbs.net

I'm delighted to say that an Atari Jaguar actually made it onto the front page of the Dallas Morning News today. It shows an Atari Jaguar with a CD addition and Battle Sphere plugged into the top of it. This picture was an introduction to the personal technology section where you see a bigger picture of the Atari Jaguar below a really large picture of an Atari user holding 2600 games while an Atari 800, ST, and 2600 play in the background.

Check it out! It's pretty cool!

As far as I can tell, there is not differnt in the various menu
options. The only change is that the latest beta supports long file
names (including names with a space between the word, e.g. 'that is me.jpg')

It also supports true color now, which wasn't the case with the
previous version.

Providing the file format is the same, just format a DD disk on the PC. Bung
it in the Atari and copy the files across. The Atari can read and write PC
disks without extra software. If you have a HD disk drive then you can use
PC formatted HD disks instead.

Just to ramble on some more. I think I have now tried almost all the emulators, and wouldn't it be wonderful if they were all rolled into one. I think I like TOS2WIN the best, and would think about paying if the MIDI worked. After that its down to what you want it for. The hard disk -> FAT support in WinSton seems broken. It seem to write the files correctly but then can't walk the resulting tree. perhaps a problem with FAT32?.

Any way must go before my wife kills me ....

Dave Wade.

1934. USA ISPs that work with STinG?

Newsgroup: comp.sys.atari.st
Date: 2000-08-17 00:00:00 UTC
From: nurmix@socal.SPAM
Message-ID: <8nh8v6026tv@enews4.newsguy.com>
Source record: 58322

Hello all,

My current "pay for use" ISP is going away at the end of September - at least they are getting rid of their dial up service. And I've been with them for the past 7 years or so, and use them for e-mail and my new server feed, and it has always worked well with STinG. I've also been able to get a free ISP (called Freewwweb) working with STinG, but is has recently disappeared. So, unless I find another US ISP that works well with STinG, my Falcon will no longer be on the Internet. :^(

Yes, I do have a PC that is connected via a couple different free ISPs, but both of these require special Windows dialers / software to function, and therefore won't work with the Atari. Plus, I'd like to continue using NEWSie and POPwatch etcetera even though I do have the PC.

I've seen some folks here using Earthlink (with STinG), and I know that some other ISPs like Juno claim to work with any PPP-supported platform. I was just looking for some suggestions of STinG-friendly ISPs; either free or pay for use in the USA. Any help would be appreciated!

P.S.

** My e-mail address "nurmix@socal.com" will no longer be valid at the end of September. However, I can be reached at "nurmix@yahoo.com", or via the e-mail link on my web site.

The IEEE-1284 cables allow for the printer to talk back to the
computer. Some printers like to do that from time to time.

Well, Janka, it seems that we can put this discussion to bed:

NVDI 5.03 will run the ESC/P Raster protocol of Epson Color Stylus
Printers.

One other question...of the Atari computers, I don't think the STs have
bidirectional parallel capabilities (although I could be wrong). Are
you using an ST, a TT, or a Falcon?

Thanks for all your efforts,

Galen

From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <GLE30yA7bGn5Ewko@lovecraft.demon.co.uk>
Source record: 58330

I don't believe it.

I get the STE keyboard sorted. I get the mouse sorted. It takes Analogic 2 weeks to deliver a monitor cable they said I would have in 2 days.

I download the right software for my synth, and it can see MIDI. It can send MIDI. When I try and download the patches, I get 2 bombs.

I calm down. Download some different software.

Go back to the machine, start to load GENEdit again.

Bang.

The PSU blows.

I'm beginning to think that even a 4Mb STE is a very attractive doorstop.

So - before I throw this lot in the general direction of where it came from, can I use a PC powersupply? I know most of them trip if they don't have a PC motherboard with a video card attached, some sort of 'power good' line. Any way of doing this?

Otherwise, there's a functional 4160STE with dual TOS, 1.44FDs, fast serial, but no PSU, CM8833Mk II monitor, and an ICD Link2 going to be up for sale, and it will be the last time I give anything Tramiel related a go. This is nearly as bad as my C128D.

Richard, trying to be calm but really would like to take a bloody big hammer to this machine now, never mind being unspeakably angry at the person I got it from.

Hello all,

I went ahead and ordered the upgrade to HDDriver 7.91 from Uwe. Actaully it has worked out well. I do not have to turn off the Instruction Cache to install the SYS file or to run the utilities program like I did for version 7.73. I still have to turn it off in order to use my Jaz drive. I did notice when I did this the speed of the drive is not all that much slower. I still have verion 7.61 that I can go back to, but so things are fine. As long as I can access my CD driver and Scanner (which I use alot more than my Jaz drive) I am satisfied.

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

You can use a SVGA moniyor with an st, but only in mono mode's. Work's well though. Basically you need an adaptor, Mario Beecroft is the only one I know of that actually sell's them, they are quite easy to make though....

Just as a yard stick, what type of Atari's are you guy's running. I am thinking of buying NVDI 5, for my 32Mhz Falcon, but dont know if it will actually print at a reasonable speed.... Speedo sux, and Pagestream takes around 10-20 minutes at 720 DPI on my Stylus Colour 400, would NVDI and Papyrus be faster?

Sorry, should be IEEE-1284. It's a bidirectional drilled cable with
25 line parallel on one end and 37 pins connected on the printer
side and it costs twice as much as a normal parallel printer cable.
That's as much as can be read on the box and I don't know more of
it except that some EPSON printers seem to need that line splitting.

After reading your requirements I would recommend going for a Mega 1 instead. This later machine has TOS 1.4 as standard, one of the newer double density drives and an improved power supply. I think you probably just got unlucky with that Mega 2. My Mega 1 was upgrade by a licenced Atari repair centre to 16Mhz, 4MB, HD disk, Overscan etc and I never had a problem with it. The guy I sold it to managed to blow the PSU but he replaced it and it worked fine again.

1958. [HELP] Installation instructions for PC-Speed

Newsgroup: comp.sys.atari.st
Date: 2000-08-18 00:00:00 UTC
From: french-lines@usa.net
Message-ID: <8nitk5$7l7$1@nnrp1.deja.com>
Source record: 58249

Hi,

Many years ago, I acquired a "PC-Speed" hardware device which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

I'm wondering if the STE itself has a fault!

Atari's a usually very reliable, and I have NEVER known of ANY software
that would cause the psu to give up the ghost.

I have heard of power supplies from pc cases being used. I've never
heard of any 'tripping'!! they are, however, usually switched mode psu's
and need a load on them to run.

Learn the difference between a ROM and an .ST file for a start. The only ROMs an ST uses are TOS ROMs and cartridge ROMs. .ST files are disk images and you need a program to save them to an Atari disk. I'm not aware of one but there must be one around somewhere.

1962. Exploding PSU - PC replacement?

Newsgroup: comp.sys.atari.st
Date: 2000-08-18 00:00:00 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <Nu4l95DIiTn5EwWA@lovecraft.demon.co.uk>
Source record: 58253

Okay, I've decided no more ST PSU for me. I've got a 145W PC PSU, which I have removed from the chassis, mounted the power switch on the metal case (it looks... interesting. The 240V cable, all thankfully very insulated, with the bit that it attached to the front of the PC now attached to the PSU. Like a little plunger ;)).

The PC wires are coloured red, yellow, black, orange, blue, and white.

I'm thinking: Black is ground. Red is +5V. Blue is +12V. That's what I need for the ST. What are the white, yellow and orange wires? There are multiples of the ground and red.

If I put, say, 2 red wires into one end of a screw connector, and connect that to one of the ST 5V lines, will it be providing 5V (with twice the current available) still? Or will that cause it to be wired in series, and providing 10V?

Richard, doesn't want to wreck a PC PSU. A floppy drive will presumably not provide enough of a drain to prevent it shutting down?

>multiples of the ground and red.

be careful. On most PC PSUs, +12V is yellow (check the colours on the disk
drive connector cables - normally, these are red, 2* black, yellow).

However, this is not quite standardized, so be sure to check the voltages
before connecting the ST. Make sure not to run switchmode PSUs without load
(1A on the 5V rail is usually sufficient for PC-style PSUs, an old 5.25"
harddisk drive will work fine as a dummy load for most PSUs).

A PC PSU will also provide -5V, -12V and a power good signal - simply leave
these unconnected.

>If I put, say, 2 red wires into one end of a screw connector, and
>connect that to one of the ST 5V lines, will it be providing 5V (with

Yes.

However, I would suggest soldering the connections - screw connectors tend
to loosen up after time, especially when multiple wires are put into one.

I posted a message about two months ago stating that I paid $66 to Pat Barnes in Alaska to buy two used SM124 monitors. I just received the monitors about 3 days ago, so it turns out that this guy did not cheat me, but just took a very long time to deliver. I just wanted to post this message to clear things up, and I'm happy that everything worked out.

1967. Re: Exploding PSU - PC replacement?

Newsgroup: comp.sys.atari.st
Date: 2000-08-18 00:00:00 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <2KHrEuG2MWn5EwC2@lovecraft.demon.co.uk>
Source record: 58258

Once upon a time <8njklrnrb1@draco.stochastik.rwth-aachen.de>, Michael Schwingen <michaels@draco.stochastik.rwth-aachen.de> grabbed chalk and scrawled:

>be careful. On most PC PSUs, +12V is yellow (check the colours on the disk
>drive connector cables - normally, these are red, 2* black, yellow).

Checked - mine is:

Red, 2 x black, Orange.

The PSU wires to the PC motherboard are:

3 x red, 1 yellow, 2 x black on one connector, then 2 x black, blue, orange, red, white on the other.

From a motherboard view, this gives:

- Red
- Red
- Red
- Yellow
- Black
- Black
- Black
- Black
- Blue
- Orange
- Red
- White

Given that PC motherboards are standard usually.

I'm now assuming - red = +5v, orange = +12v. The other leads aren't important? I know this PSU will power an external HD floppy drive.

The Atari appears to have:

- Red
- Red
- Black
- Black
- Black
- Blue

Where Red is +5v and blue is +12v.

>However, this is not quite standardized, so be sure to check the voltages
>before connecting the ST. Make sure not to run switchmode PSUs without load
>(1A on the 5V rail is usually sufficient for PC-style PSUs, an old 5.25"
>harddisk drive will work fine as a dummy load for most PSUs).
>
>A PC PSU will also provide -5V, -12V and a power good signal - simply leave
>these unconnected.

The white is probably the power good...

>>If I put, say, 2 red wires into one end of a screw connector, and
>>connect that to one of the ST 5V lines, will it be providing 5V (with
>>twice the current available) still?
>
>Yes.

In that case, each 5v line on the STE gets two of the PC PSU 5v lines,
two of the grounds will get two of the ground leads, and the other, 1
ground lead, and the 12v will be straightforward :)

>However, I would suggest soldering the connections - screw connectors tend
>to loosen up after time, especially when multiple wires are put into one.

This is more to test if the STE is running okay, and it's just my PSU
that blew. If it works, I'll make a soldered connection and attach a
6-pin plug to the ST and a socked onto the end of the PSU lead.

Wish I still had some spare Apple // PSUs!

Richard, off to check the web for PC PSU pinouts.

Kilpatrick <richard@lovecraft.demon.co.uk> grabbed chalk and scrawled:

>Wish I still had some spare Apple // PSUs!

Success!

Just used 1 ground, 1 +5V, and 1 +12V - Paired the Atari PSU wires, and
joined using a block connector for power and a female/male spade with
insulation for ground, fired it up (also with the smaller drive cable
connected to the external drive) and - success! I have a functional STE.
Now all I need to do is lengthen the wires, isolate those not being
used, and I can make the whole lot neat.

Now I need to find out why GenEdit crashed ;)

Hmm... why does v6.30 work, then? And versions up to 7.60 (or so)? And I thought it was caching DATA that was the problem, not instructions. Btw Uwe, I can't for the life of me find my 6.30 disk, thats why you haven't received my update request yet :(

>Now I need to find out why GenEdit crashed ;)

Update, again. Left it running a demo (Equinox), when I returned, it had stopped with horizontal bars on the screen. Press reset, bars are still there.

Hmmmm...

Press-n-hold Reset, go to 2.06. Bars still there.

Switch off, mess with RAM, back on. Working again.

I've got Parity in one bank (2 and 4), and standard in 1 and 3. I've cleaned the connectors. Could the RAM having a poor connection have killed my old PSU?

Not that I'm that sad about it now - it used to run much too hot - now the ST is nice and cool, and the PC PSU is of course fancooled :) I'm leaving GenEdit alone, since it appears to crash regardless of TOS - MIDI data is visible using the monitor function, but any attempt to actually play or change Patch data causes 2 bombs. Recording doesn't seem to do anything :/

Any other ideas for software?

Richard, thinks the frankenstein ST system I have now looks cool, in a 'by rights this lashup shouldn't work at all' way.

Source record: 58269

hi all
I need some help with NEWSie.
recently I have noticed that when I press down the right mouse button to bring up the menu window, and then select transfer, that I am presented with a scrollable list of mailboxs half of which is blank!!
the next and succeeding times I go to transfer mail there are fewer and fewer mailboxs listed until the suppossed list of mailboxs is entirely white and blank! and clicking on the blank list does nothing (of course) but put me right back into my inbox.
this happens in magic and tos and(i think) MiNT.(haven't checked for a while)
has anyone else experiencd this?
i have 32 mailboxs and 96 directories(including the offline directory) in my mail directory. the directories seem to be related to the date that mail was received. Is there an upper limit on the number of mailboxs or directories??
thanks for any help

Which was can you use a PC monitor with an Atari, to which I answered to the best of my knowledge. I didn't mention SVGA because I didn't know if it would work or not. But in any case there are going to be times when you really want a colour display and multisyncs can give you that (and extra screen resolution) as well as monochrome. I can't remember exactly what I used to get from my machine but I think it was something like 720x480 (mono) without the need for any extra video hardware.

So, this would mean using my set mmu tools would make the latest versions
work? I know that Hades.acc sets up the transparent translation registers
so that hardware read/writes are cached.. not good ;-) I have set this up
not so, ofcourse.

Anyone running MiNT on a Hades and have hddriver above 7.60 want to see
if this is fixable by not caching hardware accesses?

>I'm thinking: Black is ground. Red is +5V. Blue is +12V. That's what I
>need for the ST. What are the white, yellow and orange wires?

Depending on the type of PSU, 1 would certainly be -12v, a + or - 24v line and a power good line, to tell the host CPU that the PSU has started correctly and is running at optimum, however they could be completely different.

>There are multiples of the ground and red.

They are multiples that all origionate from the same point.

>If I put, say, 2 red wires into one end of a screw connector, and
>connect that to one of the ST 5V lines, will it be providing 5V (with

>series, and providing 10V?

No, you'd get no more current or voltage, however the reduction in resistance of the wire feeds that results from connecting like colours as you mentioned could be benefitial if your machine is modified leading it to draw large current peaks.

Windows ME is a horrible, horrible piece of crap. Do your self a favour and go back to an earlier, less bug ridden, version of Windows.

Paul - Earthlink works well with STinG and has the advantage of having a nation wide network of local numbers. It is very easy to set up - I have been using them for about 8 months now with little to no problems with the exception of their newsfeed. In a word it stinks. Very slow - regardless of the platform being used. It has gotten better in last few days, but only time will tell :)

> my Jaz drive) I am satisfied.

It's fine that it works for you but anyway others should note that the
Hades is not officially supported anymore and that before ordering
HDDRIVER (update or full version) for the Hades you should check whether
the demo version works.
I really don't understand why Fredi doesn't fix this obvious instruction
cache bug in the Hades BIOS. How can he claim that everything is correct
with the BIOS' cache handling when at the same time with activated cache
some software doesn't work since the cache is not set up correctly ...

You register by paying a fee to the author. The README should contain
additional information. Or contact Julian Reschke directly:

http://www.muenster.de/~reschke/index_e.html

> The PD drive needs to have the switch marked <LUN> set to <ON> and you need
> to have a PD disk in the drive when you boot.

You can also set this to off. HDDRIVER supports both modes and the
latest version of SPIN! (only available for registered users) also
supports this.

Yep sorry Jo.

I didn't really explain properly. When I said change the settings in
HDDriver I meant there might be a setting that can select whether the
HD automatically boots or not. A quick check over to it does show (in
the general settings options) that there is a drive letter to be put
in for which drive to boot from.

The next thing for Hallvard to try is a sector test to see if anything is
damaged. It could help.

yes it is, as a matter of fact I'm experimenting with that aspect at
the moment.

NoSTalgia, the ST emulator for Mac, happens to also emulate the ST's
MIDI ports when you use it in conjuntion with Opcode's OMS MIDI driver
software - AAMoF, I was playing around with Tiger Cub last night with my
MIDI setup and was pleased with the performance.

You can find a link to this over at www.emulation.net .

Hallo Jo Even!

JES>I guess this can be "fixed" the same way we do it on Afterburners.
JES>boot with AHDI or a minimal HD-Driver

Is this really neccessary? Why not just start with caches off, and activate
these caches later when Odd Skancke's driver is loaded? This should bypass all
cache-related problems during bootup without the need of having two hard disk
drivers started.
Luckily, neither my CT2A Falcon nor my Milan 040 have this kind of problem :-)

Hi there, I have a question about Hard Drives.
I have a Syquest 88 Meg cartridge Scsi drive, and what I <think> is an ICD Link cable to connect it to my Mega Ste. I have found that I can't boot from this drive because no drives or partitions are recognized by the system. Also I am using HD driver 7.6. Is it possible to boot from this type of cartridge drive, or will it work only when part of a chain? Also, I am using HD driver 7.6. Perhaps I need to get the "link 97" cable for this to work?
Thanks for any info, Mark

I guess this can be "fixed" the same way we do it on
Afterburners. HD-Driver > 7.12 can't be booted properly on Afterburners,
so you boot with AHDI or a minimal HD-Driver => 7.12 and run HD-Driver
from the auto-folder, after the MMU has been set up properly.

>Why doesn't the drive boot by itself?

Hi Hallvard!

Stick a jumper in for master operation. I have ST-1772 (i think) and
it works fine with HDDRIVER 7.12 and 7.8.

The ST-xxxx range from seagate are all from the same family; Medalist.
Therfore they should act the same.

TOS 2.06 certainly allows booting from a hard drive.

Try fiddling with the settings in HDDriver. I'm wondering if it's
that IDE interface you have. (is it that DIY job your mega?)

Hi Jo,

You can run the driver (in the auto folder) off from the floppy to get
access to the HD then use the utility programme off the HDDriver
floppy disk to change the settings/configure the driver. Click on
install onto C partition and it'll create HDDRIVER.SYS on the root of C.

Then next time it's booted it should run HDDriver.

Or have I miss understood the problem?

Hi all,

New version of AtarICQ can finally create an ICQ account for you! :))
Since we got this working, program status is changed from alpha to beta.

Quite a few more changes, go to my site for the details:

http://gokmase.atari.org

regards,

Joakim

MagicMac will run GEM software quite happily. The latest program to actually
emulate the machine is PowerST, try www.emulation.net for more info.

> Or have I miss understood the problem?

I think so, the problem is that it doesn't boot when HD-Driver is
installed on the harddisk. Booting from a floppy works fine I believe.

I don't know your tools, so I can't tell. Anyway, your tools are not
started before but after HDDRIVER, aren't they?
It's Fredi Aschwanden who should fix this since it's him who should be
maintaining the Hades BIOS. The Milan doesn't have these problems since
here everything was done correctly.

You can boot from such a drive like you can boot from any other drive.
Except for the fact that the cartridge can be changed removable media
drives don't differ from normal hard disk drives.

I was looking after this computer for a friend of mine while he took a
"tempory" job in the States.

Anyway, now the jobs turned permanent, and he wants me to sell it for him.

Atari 1040STfm
Atari hi-res mono monitor
Some original software
External floppy drive (but no power supply??)
about 500 discs with games etc. on them
Scart lead

other bits and bobs

I have to admit that I know next to nothing about ST's, but I'll try and
answer any further queries.

I'm located in West Yorkshire

Asking £100 ono

e-mail me if your'e intersted, or if you want further details.

Oh I sold my machine ages ago to buy an Apple PowerBook 165 (which had only just come out). I used to use MagicMac when I was still using 680x0 based Macs but when I switched to PowerPC Macs I didn't bother to upgrade Magic (I'd already lost most of my Atari software in a fatal hard disk crash). I ocassionally use PowerST though.

-Andrew

But if you have a PowerPC based Mac you should go for PowerST instead (by the same author). From the documentation:

Minimum configuration:

- Power Macintosh,
- 18 Mb free RAM,
- 256-color display.
- Quicktime 2.5 for MIDI OUT.
- OMS for using PowerST with MIDI hardware
(you can get OMS at http://www.opcode.com/).

The following functions are supported:

-MC68010,
-ST Ram from 512Kb to 14Mb.
-Video shifter (320*200, 640*200 et 640*400),
-MFP (Timer a-d),
-ACIAs,
-IKBD: keyboard, mouse and 2 joysticks,
-All interrupts with priorities,
-FDC supporting .ST and .MSA format disk images,
-Rasters (Low and Medium resolution),
-Blitter,
-Hard Disk Drive in DiskCopy format (TOS 1.4 needed),
-RTC.
-MIDI via QuickTime (OUT only) and via OMS (IN & OUT).
-Printer port.

The following is not emulated:

-Serial port

Source record: 58214

Eucalypt Software - Makers of Autopost & Rocketfuel --- Ripped Me Off!!!
-
All potential buyers should be warned to steer clear of this company. They have a repeated pattern
of ripping people off and ignoring requests for support.
-
I know someone who sent in the $10 registration fee for Autopost TWICE (thinking the first one may
have gotten lost) and in both instances, never got a registered version of the program and all of his
emails were completely ignored.
-
I myself purchased Rocketfuel on-line and had to pull teeth to get an unlock code. The web site was very
quick to take my money, but no registration/unlock code came for days and days. I repeatedly emailed them,
only to receive nothing but autoresponses. After 5 days I sent them a message stating that if I did not have
a working version of the program by the close of business that day, that I would challenge the credit card
charge. Magically, the code arrived several hours later.
-
What kind of way to do business is that?
-
In any case, its academic... there are other products available for free that do virtually the same thing
and I only wish that I had known about them before I wasted my time with Eucalypt Software.
-
If your in need of automatic news posting software, there is nothing better than "NNTP Power Post 2000".
It's graciously been made available free from the following web site:
-
http://net-toys.8k.com/
-
Save your money... your time... and the aggravation!
-
Peace,
-
PPN
-
-
PS: I have no affiliation with the makers of PowerPost 2000.
-

Been down this road before...
Before I had a machine that would work on ebay...
I'd send a bid via email to the auction types.
If you're interested, don't give up.
You might be surprised at all the stuff posted on Ebay that
never gets a single bid...
So...don't be shy about emailing bids to these guys.

Is anyone using Papyrus Office together with fVDI? If so, are you able to create reports from the database module, or does Papyrus crash when you press the Create Report button?

Disabling fVDI solves the problem, I've also tried every option I can think of in NVDI.SYS.

<stevesweet@bun.com> grabbed chalk and scrawled:

>I know where there is a T28 powered STE with a recently repaird PSU that is
>available
>for purchase in the UK. Also has a fast serial port mod.

What's a T28?

STE update: The PSU worked, and is doing what it needs to - the idea of
bunching up cables would make sense /if/ the wires going into the ST
weren't the narrowest point ;) So I've had a relatively stable STE.

I've checked in the box, and found the RSVE board was wrapped in masking
tape - I've checked this, there are three unused wires (two of which I'm
assuming are for an LED mentioned in the readme file). It's now
unwrapped and mounted on the internal shielding. The PSU baseplate has
been refitted to act as shielding, and I'm fitting a 3v battery pack
with a jackplug and a suitable flying lead to plug the RTC cart in.

Of course, there had to be a price to pay for all this, I was
transferring files and I'd forgotten to hook up the external floppy's
flying lead from the PSU. So I did so (whilst the PSU was on). Seems to
have been a bad move, now I can't access HD discs at all, or format
them. *sighs* I'd been trying to work out how to install a plug and
socket for it.

Still everything else works ;)

It's in the USA, so it isn't too much use to me. Still, the ad got my
attention - UK people use eBay less. $259 is okay - but it's evidently
being pushed as a 'collector' item. By rights it should have L@@K and
MiNT! in the header :/

Richard, really dislikes eBay sometimes.

First you need a SCSI host adapter like the LINK97 in order to be able
to use more than 1 GByte of this drive. Otherwise only the first GByte
is accessible. The maximum partition size for TOS compatible partitions
on the MegaST2 is 512 MByte or, with MagiC or MiNT, 1 GByte. A current
driver with the requires features is HDDRIVER:

Since Fredi seems to prefer patching software packages instead of really
solving the underlying problems with his architecture: Please note that
Fredi is not allowed to distribute any patched versions of HDDRIVER. He
doesn't have any licenses for current versions of HDDRIVER anyway.

This is not correct. There is no such setting. HDDRIVER always boots
from the first executable partition or from the partition you configured
HDDRIVER to boot from *if TOS succeeds in bootstrapping from this
partition*.

> The next thing for Hallvard to try is a sector test to see if anything is
> damaged. It could help.

Most likely nothing is damaged since otherwise you wouldn't be able to
install HDDRIVER at all.

Are you sure your Syjewt is parallel and not Apple-Mac SCSI (25pin D type)?...if it is then all you need is a slightly off-the-wall, but not too wierd converter....

2040. Atari 1040ST Memory Upgrade

Newsgroup: comp.sys.atari.st
Date: 2000-08-21 00:00:00 UTC
From: Michael Gale <mgale@bitflash.com>
Message-ID: <Opgo5.1256$Td.33257@news.magma.ca>
Source record: 58147

Hi,

I recently purchased a hard drive for my Atari ST, and it works great. The problem is memory. When the drivers for the hard disk are loaded, it doesn't leave a lot of room for other software to move around. Is upgrading an Atari 1040 ST's memory a big chore, or is the process a "no brainer?" Does anyone know the sizes and types of memory available?

Thanks,
Michael

2041. Moving Software Around

Newsgroup: comp.sys.atari.st
Date: 2000-08-21 00:00:00 UTC
From: Michael Gale <mgale@bitflash.com>
Message-ID: <Fwgo5.1257$Td.33163@news.magma.ca>
Source record: 58148

Hi,

Over the weekend I tried copying software from a floppy to the hard disk, which worked fine. However, when I tried to run the application, it kept trying to reference the floppy drive. Is there a particular file that needs to be changed in order to handle the relocation? I am assuming that the data specifying which drive (or path) to use is stored in a configuration file (good) and not hard coded into the software (screwed).

Thanks for your help,
Michael

Mï¿½R>

It started out at a respectible $100 or so, and then went up to around
$200. When it went over $300 I was surprised but not as much as I was
to see the final bids - it looked like a bit of a bidding war between
two people with the final bid of $715 (USD!) being placed with about
two minutes before the auction ended.

Now, make no mistake, I am very fond of my TT, and the unit on auction
had some nice extras: AlberTT card and a CaTTarmaran accelerator with
a 500 meg disk full of software - but I never thought I'd see an Atari
go for that much.

Last year at the local Macintosh Computer Club's flea market, I tried
to sell my Mac IIfx - same processor as the TT, running at 48 MHz.,
and I could find no buyers, even at $40.

I hope the winning bidder is happy with his purchase - suddenly I feel
a little better about my machine too.

Regards,

Hi Steve,

I'm using an external SCSI Syjet 1.5gig drive on my Falcon. My Syjet has 2 SCSI ports on the back, and they are both "SCSI-2", which is 50-pin High Density. Same number of pins as the 50-pin Centronics - just more compact. I didn't know there is a parallel port version of the Syjet. I would think there is a SCSI-1 to SCSI2 converter. I don't know about parallel, though. Oh, the Falcon has a SCSI-2 port.

Hope that helps,

Clayton

Keeping the listeners to Radio 5 Live's Sport coverage happy, and adding more translations to the web site. Actually, not so much a translation as the reappearance of the XBoot Y2K patch file. No support for this one people, so please don't ask. The patch works ONLY on unpacked versions of the program.

Other translation work not connected with DDP continues...

> as a complete download for personal use.

This is not the case in the UK at least. Fair use (for journal articles) amounts to making a single copy of a single article from a single issue of a magazine *for personal use*. You can copy two articles from two different issues, but not more than one from a single issue. You can't re-publish or distribute without getting permission/paying royalties. Educational institutions make Copyright Licensing Agreements to allow for class sets etc to be copied and fees paid appropriately. You can also get inter-library loan photocopies of articles for loan to users (as opposed to single copies for individual users) but you pay an extra charge for copyright clearance.

> I am not a lawyer, but I do run a business and have to knwo at tleast a
> little bit about these things.

I am not a lawyer either, but I am a librarian and it is part of my job to know the guidelines on fair use for photocopying (as opposed to the small print of the law on copyright, though I have colleagues who have more detailed knowledge). Re-publication is forbidden completely unless you have clearance from the copyright holder. Isn't the US now signatory to the Berne convention (think that's the thing...)? In which case you might find the law is tighter over there than you think, but I can not speak authoritatively on that.

BTW (and this is not a personal remark or intended to be offensive in any way, just an observation) in my experience, business people are remarkably cavalier in their attitude to copyright. Though this may be more of a reflection on our business studies students...

MagicMac is NOT and Atari emulator. It is a GEM compatible operating system.
Just try running some low-res games on it and see how far you get.

> J>Is it possible to use a Mac for this purpose?
> Why not? Or does your Atari soft need some hard the mac doesn't have?

There is a way of using Atari MIDI via Mac serial MIDI with MagicMac. I
think there is also a PDS expansion board with built in MIDI ports.

Hi

Are you saying that you can't format HIGH DENSITY disks or HARD DRIVE!

I know you aren't suppose to power up devices when the machine it on,
but sometime it can't be helped!

I've switched on my external drives on while the Atari has been powered
lots of times without any bad effects.

If you are trying to format a high density disk (1.44m) using a double
density (720k) drive, you WILL run into problems! EVEN if they are
formatted to 720k!

I have only ONE drive that can read a formatted HD disk formatted as a
720k!! All it takes is one tiny little BIT and your data isn't what it
suppose to be!

>MiNT! in the header :/

Hi

UK users use Ebay less!!!!! I'd disagree slightly, only slightly:)

UK is hell of a lot smaller than the US, AND is world wide, catering for
the world as a whole.

If you want to aim at UK users then use www.ebay.co.uk .

They were offering FREE listing up to 4/7/00, so you have to pay a
listing fee and commission on the final price of your item:(a big
drawback, especially to reserved price items (sellers only)!

Some items you may not find anywhere else, especially rare collector
lots.

Once upon a time <vZJx3JAHhQo5Ew45@steverosie.demon.co.uk>, Steve
Stupple <Steve@atari.org> grabbed chalk and scrawled:
>Hi
>
>Are you saying that you can't format HIGH DENSITY disks or HARD DRIVE!

HD floppy. My machine is upgraded with external and internal HD
floppies, powering up the external isn't really the right term - it
doesn't have a PSU, it's run directly of the PC PSU so I just plugged
the power connector on!

>I've switched on my external drives on while the Atari has been powered
>lots of times without any bad effects.

They're probably using real PSUs ;)

>I have only ONE drive that can read a formatted HD disk formatted as a
>720k!! All it takes is one tiny little BIT and your data isn't what it
>suppose to be!

No, this is proper High Density, in a 1.44 drive. It's fine with 720K,
and it's not the HD select wire causing problems. Completely random
behaviour - once, it formatted all the way, but couldn't write the FAT,
once it formats to track 6 and stops, once it even started writing the
FAT and complained Side 0 hadn't been erased. I think I've damaged one
of the heads, perhaps a power surge or something :/

The internal drive is working perfectly :)

Richard, getting good at vandalising STEs it seems.

Thanks to Jo and Claes for the suggestions. They both worked, or rather will work. <G>

The floppy fix was a breeze, just the connectors being removed and reinstalled did the trick. The mouse is being a bit more difficult, tho'.

Every time I plug in an Atari mouse, it breaks a connector apparently. Plugging in my Practical Peripherals mouse is no problem. I think what I'll do is "jumper" the connector to the next point down the PCB with real wire and avoid having to maintain trace integrity. Then I'll go through my boxes and find a different Atari mouse. I know I have one more. <G>

It looks like I'll have to buy another adapter to hook my SyJet 1.5Gb drive up to my 1040STF.

The Link adapter is a Centronics 50 pin male so I'm guessing I'll need a female 50C to female parallel. That means two cables, and three adapters!

Anyone know of an alternate way to hook the drive up?

Thanks,

Trenchcoat Steve

Hiya

Buy a pair of joystick extenders, or 2 and keep one for spare! These cut
the aggro that the joystick/mouse ports get when unplugging and
plugging. It makes it dead easy and you don't have to lift the computer
up to change again:)

What is the drive and what port is it designed to run off?

If it's a SCSI drive designed to run off the parallel port, then you
would be better off buying an external casing and fitting it in that.

If it's an other type of SCSI, then a gender changer may be the
solution! This will be only 1 adaptor then.

IIRC the Links are SCSI 1 & 2 compatible.

>
> Gerhard
```

I don't have a 440 driver.
But would be great if you can see if the Falcon speed has influence on the printing speed.
Yesterday i printed a A4 document (text and pictures), 360 dpi and full color mode, it took 11 minutes, i printed the same document with a HP deskjet 970, using the 870 driver and 360 dpi and full color mode and needed 6 minutes, i think is still too slow comparing with my father's PC.
When you say that you printer needed 2:40 minutes. Are you meaning since the priter start to print or since you choose the option PRINT with the mouse?.
I ask this because since i click PRINT and the printer start to PRINT it needs 3 minutes of the 11 minutes i told you before.
You were right, my Epson 460 works OK but too slow, the problem is that i don't know is because the driver or because is a Falcon speed (16 Mhz) limitation.

```
Thanks for your help.
David Galvez.

Thanks for the info. The thing is that for V0.95 I sent Rainer the
translated strings and he recompiled them into the binary. I mailed him
some time ago about 0.97 but didn't get a reply.

When I get hold of it I'll see whether the strings can be replaced in a
hex editor. ISTR that some were too long, so it may be a bit of a bodge.

>without the need for any extra video hardware.

One word of warning - many of the newer Multisyncs will not work down to
15 kHz TV resolutions, which is what the ST uses in Lo and Mid-rez. The
old NEC 2A did but I understand many later versions do not.

On the question of VGAs on Ataris, I am using an ancient IBM PS/2
monitor (that someone threw out with their PS/2 50 computer) on my
Falcon in 640*480 mono as well as 16 and 256 greyscale without problems
- and I have no reason to believe it wouldn't work with the ST too,
though I haven't tried it. And that was built before there was SVGA :-)

This can be a poor connection somewhere (loose chips, bad soldering,
broken wires...) or a DMA problem. If the DMA chip doesn't start up you
get exactly this problem. The cure is a better DMA patch.

>> started before but after HDDRIVER, aren't they?

> No, they are not :(

Then - as I already proposed here some weeks ago - create a bootable
floppy disk where the bootsector code runs your setup tool. As GEMDOS is
already initialized at that point, running a program shouldn't be a
problem. You may need to set the correct current drive and working
directory before doing so, though.

Or simply create a bootable disk that switches the caches off for the
booting stage.

Ciao

2082. DISK Images

Newsgroup: comp.sys.atari.st
Date: 2000-08-22 00:00:00 UTC
From: Miles Redford <milesred@cadvision.com>
Message-ID: <39a2420c_7@news.cadvision.com>
Source record: 58174

hi, I seem to have a disk problem of some sort. I do have a brand new floppy drive, but I can't seem to make any kinds of atari disk images with it.
I have tried many different formats, I do have a 520st here too and a DD DS floppy and a SS, so I can make lots of real disks, and have about 300 or so as well.
I have tried makedisk and gemulator explorer. gemulator just freezes, makedisk makes an image, but it is always empty. if you can even look at it I can however see and use the ones I have downloaded off the internet.
is there any help docs anywhere for any of this stuff?

thanks...

I know it already works now, but as it didn't before: _How_ did you
install hddriver.sys onto C:\? By simply copying it, or by using the
proper option in HDDRUTIL? The first won't do what you want, maybe by
"fiddling around" you've now done the latter?

Ciao

> unfortunately you have not the possibility to secure MiNT like
> UNIX

Depends on what kind of security you refer here. It is definitely
possible to secure MiNT by login/password as any other type of UNIX
compatible system.

For example, you could install KGMD/KEMD and use its init package, then
create a dedicated GEM user with N.AES being its login shell. Note,
though, that N.AES needs to be setuid root to be able to perform various
device installations on startup. It drops privileges as soon as it's
finished doing so (at least it should do so, I haven't tested that
myself).

I don't know how the Hades work, but to me it looks like the problems
occurs during booting which indicates that the caches are already active
when HD-Driver boots.

> Luckily, neither my CT2A Falcon nor my Milan 040 have this kind of problem :-)

On the AB all caches are off by default, so I assume that the
boot-problems with HD-Driver > 7.12 are timing-related, and not
cache-related.

Hi

What software is it?

99% of serious software can run from hard drive with NO problems.

I suspect it may be a game. This may rely on disk protection, or need
the original disk in the drive to play the game.

I had this problem when I first got a hard-drive in the 1980s. Hard drives were rare and there was a lot of software about that expected to use drive A: or B:. I managed to fix all of them by opening the programs in a hex editor, tracking down the reference to A: and changing it to C:. In most cases this will work. In some you'll need to run the program from the root directory.

Hi all,

I have for sale:

Mega 4 STE
keyboard
mouse
NO monitor
TOS 2.06
4 megs SIMM ram
1.44 floppy
internal SCSI hd 210 megs
VME port/ slot... currently occupied with an extra serial port.

I want $125 plus shipping for it. I live in Seattle, WA USA, with a ZIP code of 98133. It weighs almost 18 pounds (including most of the packaging).

This is a nice unit. I thoroughly cleaned and vacuumed it out. I checked that all the keys work. I got this about a year ago intending to use it as a possible back-up in case my Falcon failed, but now that I have another Falcon I've decided I can let go of the Mega STE.

I HAD this sold to a fellow (Boris Sheikman - in California, USA), but since agreeing to buy it about 5 weeks ago, he has not sent payment or even returned my emails - I guess he doesn't want it. Rather odd, I think. I wish he'd at least tell me. Has anyone else sold anything to him. Did it go OK?

Email me if interested, or if you have any questions, thanks-

Clayton Murray
claytone@aa.net
Seattle, WA USA

I'm not aware of any current stockists. I bought my Atari T-shirt in Virgin Megastore during the retro-boom of the '90s. Embossed silver on black fuji, very nice. You could always get one of those T-shirt printing kits and make your own. Of course the Atari that's still going may have some merchandise but they've changed the fuji and IMHO the new one just isn't as nice.

Source record: 58190

Hi all,

I have got on spec. a Ricoh MP7040S CD-R/RW for burning CDs from my Falcon.
I use ExtenDos and HDDriver, both latest versions. It seems to work OK as a
commercial CD reader, albeit much more slugish than my vintage X4 IBM CD drive,
but is very choosy as to recognising home recorded CDs and completely refuses
to recognise the blank recordable CDs TDK that came with it. When CDRecorder scans
it finds it as SCSI ID 5, but its in grey and non-selectable. Can anyone help and recomend
a simple
but working CD burner combo.

Thanks in advance,

Bob King

>on always looking in A:\ would not last long on my system.

Could be that the program is looking for its RSC file on the floppy. I'm wondering if the HOME environment lable needs to be set. Memory is hazy on this point, but it might be an avenue worth persuing. I'd be inclined to search out Mark Baines' Atari A-Z text file on his web page on this subject.

I'd also like to know if other programs act in this way as well.

If it's just that one program, then it could be that it had previously been run from that floppy and had saved an INF file to it, which it's now trying to load. In that case rename the file to something else, and once the program has run from the hard drive, save it anew.

And then it might be a form of software protection. PCBoard Designer and Soundpool's CD writing software are both examples of software that may be installed onto a hard drive but which want the original disk in the A drive before they will run.

Upgrading the 1040 requires some soldering, unless it's an STe. You
can get a lot of memory back by making your buffers as small as
possible. What HD software are you using?

It really depends on the software. Some programs like STing have a
tiny file (STING.INF) that has the location of the folder referenced.
Others do this internally. Still others demand to be run from a
particular drive, but these are rare outside of games. What is the
application?

Amen. I finally got around to setting up my Stylus 740 (under NVDI
4.12). The quality is excellent, but a full page 720 dpi truecolor
took about two HOURS (I gave up on it, but when I came back, there it
was -- very nice quality). Switched to 360 dpi monochrome and it spit
out a page in about four minutes.

Although my HP 610CL is a far inferior color printer, it isn't bad at
600 dpi monochrome and can beat the 740 by a mile speedwise. I'm
wondering if a setting is off somewhere?

From: atarigalen@my-deja.com
Message-ID: <8nsjdi$rh0$1@nnrp1.deja.com>
Source record: 58166

Hello All,

I was starting my Falcon on Friday and reached around for a pencil. When I came back my monitor was informing me that it had found no signal! The Falcon's power light was on, but otherwise it was as if the Falcon was not on! A press of the reset button in back got things running normally again, but the problem has occurred a second time (Sunday).

I suspect that since the HD lights are not flashing the Falcon really isn't powering up and thus the monitor isn't the problem. Does anyone have any idea what is?

I have had this with both my Falcon's. Try this fix, remove the TOS Rom, pinch the rom socket's pin's with a needle or something to retension the socket. Get an Eraser and clean the ROM's pin's with it. If you have a 68882 do the same with that. All it is, minor oxidisation on the Socket's. Hope this fixes your drama.

From the moment the printer started to print, but for a 360 dpi
page the time from choosing the option PRINT to printer start was
about 3 seconds at most.

> You were right, my Epson 460 works OK but too slow, the problem is that i
> donï¿½t know is because the driver or because is a Falcon speed (16 Mhz)
> limitation.

It's both. As I mentioned somewhere else in the thread I upgraded
NVDI form 5.02 to 5.03 a week ago and it definitely got slower
although according to the NVDI homepage it should have been much
faster due to some driver optimization but maybe that's a problem
between the 760 and the 740 driver.

What kind of login? Is it a GEM-program or a simple text prompt? If it's
the first, you have to change N.AES' desktop to a real desktop and not the
login program, if it's the second you must start N.AES instead of init.prg
in mint.cnf.

please help him !
i need the same tool for ensoniq sampler formattet syquest cartridges...

and..
if you want to transfer the files on the cartridges from the st to pc, you
can use e.g. ghostlink (i did so) it can connect the pc over a serial port
with 19.200boud (standard modem cable).... you need time to transfer a whole
harddrive...
ghostlink is a free tool, you can download it somewhere on the web. if you
don't find it ask me.

If you have HD-Driver you can partition the disks as TOS+DOS compatible,
these will be readable by both TOS and Windows. I don't remeber in which
version of HD-Driver this was introduced.

Hi. I've just downloaded the latest version of Falcamp which I'm using on the basic Falcon configuration. One problem that I have noticed but have not seen mentioned elsewhere is that when running, if I start opening windows etc. it acts like the ESC key has been held down, ie the windows start updating. This would appear to be linked to the fact that most of the CPU time is taken up playing the MP3.. or is it? Is there a patch or something that cures it?

Thanks in advance.

It could just be that the relevant software just needs teaching where to find
things. Check under options for "settings" or similar, and if present, walk
through the options present.

Also, some software looks on Floppy for a key file to check that its an origional,
pretty rare these days but as we dont know what youre refering too...

Software sometimes also requires an environment variable defined in order to help
it find home.

Good luck, let us know the outcome.

Method 1: Go to emulators.com and download Gemulator Explorer.
. Connect your Ezflyer to your PC's SCSI port
. Transfer from drive X: to drive C:
. Of course, this assumes your PC has a SCSI card.

Method 2: Go to http://sting.atari.org and download STing.
. Set up STing using your existing service provider.
. Connect using your Atari and email yourself all your files
. Connect using your PC and receive your emails
. Note that some ISPs have limits to email size. Mine is 10 Mb.

Method 3: Buy a "null-modem" cable at a computer store.
. Download terminal-emulation software from somewhere for
. both computers
. Use said software to connect the two computers
. Transfer files

There are other methods as well (floppy transfer with archiving, buying
HD Driver, using Ghostlink), but the three methods listed above are
probably the simplest. If you don't mind installing a cheap SCSI card,
method 1 is also the fastest.

Unfortunately most games just access the floppy directly without calling TOS
so there is no way to make them use C. Of course you could try creating a
RAM DISK as drive B and running them from there.

It would help if you had mentioned the applications you are using.
AFAIK, many set their paths in an INF file. If not, in most cases you
should be able to find the path with a hex editor and change at least
the drive letter - make sure you work on a backup copy!

There are a few apps that require that their disk is present in A: as a
method of copy protection. These run off a hard disk but read the floppy
as a reference when starting.

I don't have a Hard Disc yet, I'm still waiting for my ICD Link2 and
drive to be delivered, so I can't comment on that. I'm convinced it's a
problem with the drive - I did something which could cause a fault in
the external drive, and the internal 1.44 drive works perfectly.

Could you let me know about that T28 machine?

Hmmm... it's not near the monitor - but it is near the external PC-PSU
I'm using. Out of necessity - the damn cables are too short! I've tried
moving it, but obviously by design, it's not going to go very far away
from it. Obviously, if such a device works in a PC, I don't see why it
being hooked up to an STE should be a problem :)

I'm pleased today, anyway - I found my DeskJet 520 works perfectly with
everything, and I can print the .img files I keep finding on the net
which relate to the mods in my machine :)

Hi Steve, I'm using GOLD.

I have been told that it is normal for 'blank' CDs to be invisible and that
unlike floppies, you do not format them to begin with, but that you some have to
write to and format at the same time. as I said problem is both Ricoh id 5 and Falcon
id 7 are grayed out in the SCSI bus scan so not selectable. Bit of a black
art if you ask me!!

Bob King.

Well, atleast 99%...

> system? Based on what? That the brand is Western Digital, thus ALL WD
> drives are "unbootable" on Atari IDE interfaces/TOS, or you know that

If the problem really is that WD-drives doesn't respond until they have
their geometry set (whatever that means), the only way to use this drive
is to either boot from another device, or to patch TOS.

Also, if this drive is the same as I have in my PC (850Mb Caviar, I don't
know the exact model) I can assure that it won't work - that's why it's in
my PC instead of your Mega ;-)

Syquest did make a parallel port version of the Syjet. Ive read your post
but, I dont understand what you are trying to do. If you just trying to hook
the Syjet to the Link adapter than all you need is the cable. The 50 pin
centronincs to 50 pin compact cable is made and should be available thru any
place that sells SCSI cables.

Hi all-

I have an Atari STe and possibly an SM124 monochrome monitor I'd be willing to trade for an SC1224 color monitor or software lot (among other things!)

The STe is missing all the screws and doesn't have the original internal floppy drive (the original drive is gone and someone attempted to put a PC drive in its place, I believe). The system works, however, but it could also be used for parts. :) The monitor also works, but has a few stickers on it.

If anyone is interested, please respond to jgrand@mindspring.com and I can give you more details. I have one 1040ST that I am trying to build up into a useful system (which requires software, etc.) so if you have anything good to trade, let me know!

Thanks!

Joe

> cache-related.

They can't be timing related since the SCSI protocol is not timer-driven at all but completely target driven, at least with HDDRIVER 7. So there is nothing that's related to the timing which could cause problems. In other words: There is no timing except for the timeout checks but these only are relevant if a device doesn't answer for quite a long time, almost a minute. Please refer to the SCSI specification for details. Since the complete protocol handling relies on the device to set the correct bus signals any falsification of these signals, e. g. by caching them, will lead to problems and that's exactly what you can observe with the Hades.

Whether something else was installed on the root sector is not relevant.
HDDRUTIL will overwrite the root sector contents anyway. Maybe the size
of your boot partition was larger than the allowed partition size for
TOS 2.06.

Apple made such a tremendous good job switching from 68K to PPC that many
people now completely have forgotten that the 68K code had to be emulated.
And yes, it is possible for a emulator to outperform the original, especially
when the emulating machine gets faster and faster, and the original isnt made
anymore. :-)

Hi Don,

If I understand correctly, I _THINK_ he needs a cable (or just
and adapter) with HD50M (high density 50-pin male) on one end,
and 50CF (50-pin centronics female) on the other end. If I recall
right, the Link is designed to plug right into a hard drive's
SCSI port, therefore it must be a 50-pin centronics male plug.
That would necessitate a cable with HD50M and 50C_FEMALE_. I
think the mixed gender cable might be hard to find??? Can we call
it a co-ed cable? When are they going to come up with a unisex
cable? If they do, is cloning the only way to make more? ;-)

Dear oh dear.

If ever a path wandered. You all missing the point about the PSU. Messing about with PC PSU and mains voltage can KILL.
You need a high power reliable internal replacement as supplied by Keychange Music, 01925 266120. Fits straight into the ST with no 'adjusting' whatsoever.

They also stock most of the things you can't find like Mega keyboards, genuine Cubase v3.1, brand new!!!!!, IDE interfaces for the STE, mice and trackballs and the guy is still interested in the Atari too.

Phil.

Nice of you to notice from the start.

Not mentioing where people are from is especially infuriating
when someone is selling something.

Saying their goods cost X amount of dollars doesn't help, since
dollar is the currency used in over a dozen of countries.

Saying that it should be obvious, since one is mailing from a
[com,net,org] domain doesn't help either, since those 3-letter
domains can be from anywhere on this planet.

Of course, when replying to someone's "for-sale" ad, it is best
to reply via e-mail, since what one offers for some goods
concerns no one but the seller and buyer.

The list goes on and on.

There are some good netiquette FAQs out there, such as on Yahoo.

Yup. Place a small external unterminated fixed hard drive at ID 0 in the chain as a boot drive.The link fits on one centronic connector, the cable from this drive to the Syjet, now ID 1 and terminated, then becomes a standard SCSI 1 to SCSI 2 connector. It works, Keychange Music, 01925 266120 did it for me.

Phil.

I am not sure if you can call that behaviour "broken", since I am not sure
wehat the IDE spec says about this.

It is true that WD drives seem to be the only ones that show this behaviour
and thus need special attention with TOS <4.06.

And it is not only older drives: at least the 1-2GB WD drives still have
this problem, and I suspect that they *all* simply behave the same way.

The WD drives I encountered do indeed report the correct geometry after
reset - however, they refuse to read data until they are *told* what
geometry to use (it works fine to tell them to use the default geometry
which they report).

2172. What do you need?

Newsgroup: comp.sys.atari.st
Date: 2000-08-24 00:00:00 UTC
From: baldrick@dilbert.netset.com
Message-ID: <39a52f27$1_1@athena.netset.com>
Source record: 58064

This may sound like a strange message, but I thought I would send it and see what the response was. As you probably know I've been a long time atari supporter and programmer. I may not be the best or the most prolific, but I think a large portion of you will recognize that you have seen something with my name on it go across your machine at one point in time or another. So please bear with me and if you don't like what I say then ignore it and go on with your life.

Basically I have found myself in some serious financial straights. I need to come up with a large some of money for a utility company or see a disruption in my service. This is basically their fault for misbilling, but still leaves me liable. So instead of taking a second job and losing what time I've been able to devote to atari, I thought I would speak to the community as a whole.

I'm not asking for a handout. All I'm asking is what is there, that you would like to see for your computer (within reason, I'm a programmer not a hardware guru), that you would be willing to give $10-$20 support. I'm not asking for any money up front or anything like that. Just is there something that I could write that would be worth that much to you?

It's a simple question. I'm not an unknown to the community and I'm hoping this message doesn't sound pathetic. Intellectually I know that it would be more worthwhile to do a few small products for the dominant platform on the planet where I could probably make a factor of 10-20 times the amount of money. But I would really rather do something for the atari, if I can justify it to my family.

No flames please. Just think about it and let me know.

> But from these discussions it seems like there is no easy way to know
> which drives work and don't work.
>

It seems to be so. In the past, I have only used Quantums (52 to 540 Mb),
because
I knew that they worked with ST and because the were faster than avarage.
But even then I have stuck with particular odd drive which refused to work.
IIRC 52, 127, 540 Mb worked and 270Mb was especially fast.

>
> > > I'd hate to give away a perfectly working drive only to find out later
> > > that I could have used it myself.
> >
> > I wouldn't call a drive with broken firmware "perfectly working" ;-).
>

IIRC whole problem was due to ST's lack of nonvolatile memory.
ATA standard requires for drive to be able to tell computer it's geometry, but
some
drives would refuse to work normally after that withour power cycling. With PC
this is not a problem,
since after "IDE AUTODETECT" and copying parameters in memory you have to
reboot the machine anyway,
so "faulty" drives would work without apparent problems.

Besides that, there were some issues with different flag behaviours of some models etc.
With new generations of disks emerged whole new problems of addressing all sectors, since original registers to do that
had simply too few bits. ATA had defined a few extensions to that, but it seems that some manufacturers had other ideas with
particular models....
Recently I have connected 2.x Gb HDD on the poor ST and it recognised 1Gb or so. With PC that would be bad, but for ST even Gb is like whole universe, besides my stock of old crappy 100Mb disks has run out, so I had to try with replacement :-)
Generally, with ST it's best to try before you buy...
Jeez, that reminded me, I have got new UltraATA/100 45 Gb WD drive, I HAVE to borrow neighbour's ST to try it out...

Regards,

Branko

No. The problem is that nobody thought it might be necessary to initialize
the drive geometry when writing the TOS (unless someone comes up with a
quote from the IDE spec which states that this behavious is really not
allowed by the spec).

The Milan TOS simply reads the preferred geometry from the drive, and then
tells the drive to use just this geometry - and the WD drive boots and works
just fine, without requiring the user to set geometry values in NVRAM.

The same is true on a PC if you set the drive geometry to "auto" (which lets
the bios autodetect it on every boot).

Hi there, I think your question is a good one, and a good one to ask
because its probably good for us to think about what kind of software
is going to help us continue to use Atari.
I would like to see a database type of program, where you could have
little thumbnail pictures with each record. For example, for names
and addresses you could have a little photo of each person. It wouldn't
have to be too complex a database, but the picture option would be kind of
fun.

Hello Dan,
We are all dying for a new modern stable browser that can replace CAB 2.8.
It's the thing we need most ! I'm sure all Atarians would contribute.

Cheers,
Dan de Hulster

<-- SNAP -->

Ok. Why don't the users that find Dan's existing software usable just
send a donation, as a "thanks for great software"? I think this is one
great opportunity to show that you want more software for the Atari, ppl!
Dan has written some very nice software which I think deserves a donation,
altho it is freeware. If Dan is to write new software for which we will
pay, it might take too long, and I'd bet that agreeing on a project is not
gonna be easy.. at least very timeconsuming.

So, show your gratitude now! ;-)

Hi Dan,
Firstly, a big thanks for the work you've already done!
Secondly, you can add my bid to the list needing a Javascript/SSL
compatible browser!!! (ST/TT/Falcon/Hades/Milan).
Is it possible as a module for CAB (if ASH lets you do it)?

Dan,

I'd like to follow up on both the prior posts.

a) Post your address and I'll send you some money now (I figure I owe
you for the .OVL work you've done).

b) The main thing I'd like to see is Javascript and SSL without the
need for Magic or MiNT specifically.

On the other hand, hardware drivers are always nice. Scanners, digital
cameras, printers, etc. keep evolving, but the drivers don't usually
keep up.

Well, that might be an exaggeration. A good emulator (like SEBRA) is
usable, although it isn't as clear as true ST-High. Email Kay at
uia.net if you need a copy for your AUTO folder, but use a K, not Kay.

You need a SM124 to do high res mono on your 1040. For years I had a dual monitor setup. My 1040ST with SC1224 and SM124 monitors hooked up using a Monitor Master. I still have the ST, now hooked to only the color monitor. I would be willing to sell you the SM124 and Monitor Master, together.

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/
Web info in my Signature attached to the bottom of any of my messages!

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump to my FTP site linked to my WebSite so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor & view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want to order and E-Mail me the rest of what you do want to order! To expedite things, include your complete Mailing address so I can figure Shipping/Postage and Handling. I'll be back after the weekend.

So if you don't come see me, I can't save you any money! ;-(

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/
Web info in my Signature attached to the bottom of any of my messages!

Bill,

You can really expect much for a company that no longer exists. All Syquest equipment be sold at this time is all left over stuff. My Syjet works great with my PC and cant get it to work with my Atari.

Don

>propietry
>doohickie.

The "Naughty" unpacker, as mentioned by Martin a week or so ago. It's
mentioned in the readme that's included in the archive.

Oh, and IIRC the patch doesn't work on already patched versions of XBoot
(there was another patch to allow it to work on an Atari clone IIRC).

End of support!

Erm, that should be a standard /null/ modem cable!

An alternative would be PARCP, which uses a slightly modified printer cable
between the two machines. It's a lot faster.

>Would anybody be selling either Lacescan or Overscan?

LaceScan is shareware from http://sting.atari.org

Overscan is PD from many ftp sites etc

AutoSwitch OverScan is (or was) commercial - not available for a long time,
perhaps someone has one for sale second hand. IMV this was the best of all
the three I've listed.

The easiest and fastest way is to use an EZ cartridge that can be read
and written by both the PC and the Atari. HDDRIVER supports this. No
additional software except HDDRIVER is required. See
http://home.nikocity.de/nogfradelt/atari_english.html for more
information.

> That could be. The limit is 16 Mbytes isn't it?
> I believe I have it at 10 Mbytes now.

No, even with the oldest TOS it's at least 256 MByte. The boot partition
can be as big as any other partition.

> According to the specs, the Geometry is as follows:
>
> 4960 cylinders
> 63 sectors
> 16 heads

The geometry is not relevant for deciding whether or not you can boot
from this drive. You can boot from any drive that reports its *correct*
geometry when asked for it during the boot phase. Some old drives don't
provide correct values here.

> If there's any chance it will work if configured correctly I'll ask for

With properly working IDE drives nothing has to be configured at all.
Note that you only have to configure HDDRIVER for the rare case where a
drive doesn't report its correct geometry.

> Can you tell by the specs if it'll work or not?

No, see above. The only spec that is relevant is the IDE (ATA) spec. If
the drive is fully compatible with this specification there won't be any
problems. Some IDE drives are not compatible, unfortunately.

> *this particular model* for sure won't work?

The problem is no the Atari interface but the fact that the firmware of some drives, especially old WD drives, is broken. With this kind of broken firmware you have to take special action to use these drives with the Atari.

> I'd hate to give away a perfectly working drive only to find out later
> that I could have used it myself.

I wouldn't call a drive with broken firmware "perfectly working" ;-). It only works properly if it is told its correct geometry *before booting*. This has either to be done by using a boot disk or by patching TOS. Or by using a TOS that handles this right from the start, like the Milan TOS.

Building a Lacescan-circuit isn't more difficult than installing one, so
if you don't feel competent to build it yourself (it is afterall just two
chips and some wire) I wouldn't recommend that you install it either...

i plugged out the modem and plugged the same plug of the same cable into the
atari serial port and i transferred 80MB over this cable... i thought it was
just a standardmodem cable... but perhaps a /null/modem cable will do the
work as well :-)

> An alternative would be PARCP, which uses a slightly modified printer

can you give more information about this alternative ? i am very interested
in a faster transfer possibility ! (as i said above - i transferred 80MB
with 19.200baud.... and there is still another Megafile40 waiting...)

thanks

Mirko

2217. Impossible Mission 2 + Emulator

Newsgroup: comp.sys.atari.st
Date: 2000-08-25 00:00:00 UTC
From: Manuel Polik <Manuel.Polik@Tenovis.com>
Message-ID: <39A64467.9F768FDD@tenovis.com>
Source record: 58001

Hi there!

I'm currently working on an Epyx Webshrine, covering all issues about all the classic Epyx games.

Now, I don't get 'Impossible Mission 2' running on ST-Emulators running under DOS/Windows. I tried three different images (Automation 254, Stratagem 42, SuperGAU 112) on three emulators (Stonx, Pacifist, Echo).

All I got in most cases was a line of drawed bombs.

Now, does anybody know, to get this game running somehow in DOS/W95 environment?

I'm not sure, if this is the right place, to ask ST emulator/retrogaming related questions. If not, please point me in the right direction. (I found no emulator NG dealing with Atari...)

Greetings,
Manuel

Agreed. However, if the standard allows this behaviour, we can not call the
drive "broken" - "weird" maybe ;-)

Source record: 58003

I have 2 TTs and 2 TTM 195 monitors, none of which are for sale, however, looking to the day when either monitor fails I have tried several others. None have yet managed to handle TT high res. Modern SVGAs shut down, out of range.

If you are offered any monitor alleged to work in TT high res insist on seeing it work reliably for at least an hour. It is possible to damage some monitors, try getting your money back......

Hi!

> >So you think this is a kind of feature of WD drives?

For sure!!!!!!!!!!!!!

I have the same problem on my Falcon. My solution of this problem is boot from special floppy disk ("starting hard disk" procedure is on the boot sector of flopy disc, therefore it is very quick).
Since I changed WD drives to Seagate - drive does boot without any problem!!!!!!!!!!!!!!

Sorry for my English :-)

New monitor I'm afraid. There is a mono detect pin which is used, I understand, to avoid damage to the colour monitor by the high res signals.

>>would the panel like to see translated from German to English?
>
>Very thoughtful and generous suggestion. Thank you, Derryck.
>I suggest DISKUS (Dr Uwe's, isn't it?)
Hm.... without the help of Dr Uwe Seimet, this will be very difficult, the strings are all embedded in the binary. He would have to send us the part of the sourcecode that contains these strings and then recompile the program to obtain an English version.

>It would become a "must-have" for Atarians everwhere, but I am afraid
>to use it, not understanding all its uses and options.
I agree, Diskus is a "must-have", but even translated, people still would need a very good English manual. Translating the Diskus manual is something I rather don't think about....
But then there's always Derryck ofcourse not to mention Peter :-)

Cheers from Belgium

>>to recognise the blank recordable CDs TDK that came with it. When CDRecorder
>>scans
>>it finds it as SCSI ID 5, but its in grey and non-selectable. Can anyone help
>>and recomend a simple
>>but working CD burner combo.

Ricoh isn't supported by CDRecorder! I believe only the first CDRecorder versions (1.x) recognised Ricoh, but not any more.
You can find a list of working CD-writers on SoundPool's website: http://www.soundpool.de/writer.txt .
I've used Philips CDD2000, CDD2600, Yamaha CRW6416 and CRW8424, so I can verify that all those work properly. According to SoundPool, their intention is that CDRecorder should always work with Yamaha burners, while the others aren't as certain.
Some CDR's are of poor quality and therefore they can't be read in all readers. Another problem is that some readers are worse than others and can't handle all available CDR's. Mostly, gold and silver CDR's work - but there are variations between brands of CDR's...
Some readers can't handle the CDR's if there's more than a certain amount of data - max is 650MB, but some can't read disks with more than 630MB :(
Blank disks are impossible to read before data has been written to them, so there's nothing strange about that...

Hi,
You can't use the SC1224 for other than the color modes (if you don't use a mono emulator program - if you can stand the poor picture quality...), so you need to get an SM124 or an SVGA-monitor and build yourself an adapter cable.

Ok, after looking high and low for an Atari, I bought a cool one with I believe 6mb ram, a vga monitor that connects to the lid of the machine, an eternal syquest type device that holds 44mb of data, a dot matrix printer, a color plotter, and a laser printer. Also came with a modem, but everyone has a spare one of those lying around these days.

The software it came with was workperfect, Dynacadd, and a desktop publisher that I forgot the name of.

I really wanted to get into the Atari thing and soup ths baby to the max with video cards, ethernet access, and a large hard drive to store software, mp3s, and jpgs, but those addons seem to have dried up so I think it's time to sell the sucker to a caring and loving new owner.

I still think the computer is really cool, but these days, I've become hooked on hires gui interfaces, etc.

I don't know what these suckers are worth these days, so I'll take a look at reasonable offers and choose the best one next Friday. If that fails, then I'l just put it on ebay. If you need better descriptions of the items, drop me an email and I shoot you the details.

BTW. The laser printer has a new toner cart in it as well as an unopened one as well. The external removable drive also has spare carts with something on them, I just don't know what.

2236. Free ISP with STinG?

Newsgroup: comp.sys.atari.st
Date: 2000-08-25 00:00:00 UTC
From: nurmix@socal.SPAM
Message-ID: <8o6qqe0rvn@enews1.newsguy.com>
Source record: 58020

I was wondering if anyone would care to try to get STinG to work with a free ISP I'm using on my _other_ computer (PC). By the way, as far as I know, this is a North American ISP only (so far)...

The ISP is called "1 Nation Online". It's 100% free, with _NO AD BANNERS OF ANY KIND_. Plus, they don't require any special dialer or setup software (they do offer a dialer program as an option, but it's not required).

As far as I know, this is about the only free ISP left (in the USA) that doesn't make you look at ad banners while you're connected (there were two other free ISPs like this - one was called "FREEWWWEB", the other "WORLDSPY" - however, both were recently bought out by JUNO, which has the constant ad banners). Plus, 1 Nation Online doesn't block SMTP mail which is sent from an account _other than theirs_ (which is a rare thing to find in a free ISP!).

Anyway, I've tried various settings in STinG, and can get it to dial, and negotiate the connection, but then it hangs at the end. And according to the information I get from Windows dial up networking, it's a simple PPP connection using PAP. And I know PAP works with STinG since my current "pay for use" ISP uses it, and STinG works fine there. And I've tried it with a script too, but it gets through the login name and password, then hangs on getting the IP address.

If anyone wants to try it on a PC first, go to:

http://www.1nol.com

But for more thorough technical information about it, go to the following FREE ISP Resource site:

http://www.nzlist.org

* Here you will find a huge listing of free ISPs, and more importantly, all the necessary information on setting things up for 1 Nation Online - look for the "Unofficial FAQ".

Anyway, thanks,

-Paul

Actually, this has (or was) already done, a number of years ago. A company called JMG Software wrote a database called Hyperlink, modeled somewhat after the Hypertext stuff on the Mac. I have a legitimate copy. It never had a good printer output. It was promised but never delivered. If Dan wanted to tackle something like this, maybe he could somehow obtain rights to this piece of software and continue its development. Why reinvent the wheel?

I don't browse with my Atari anymore, since so many of the sites I access use Java and all the other newer features currently not supported. So I think this is the best way to go. Drivers for newer hardware would be my second vote.

Ken

>RFK>burner combo.
>my CDRecorder (bought in 2/2000) is 3.1, but maybe there is a more
>recent 3.12?

I thought that Bob was referring to the Extendos Pro/CDWriter combo when I started reading this thread, but he's mentioned the Soundpool product now so I've got very confused!

Going by his description and my observations, the CD has been recognized but isn't thought of as being capable of writing by the CD writing software.

>My Yamaha writer must be switched on _before_ booting, unless it's not
>recognised as a writer, but as a reaader only.

Any device which needs a device driver to make it readable must be switched on at bootup, so that the necessary resources can be made available. A CD writer isn't bootable so (in theory) can be switched on at any time.

Anyway, Bob could look at http://www.cdlab.atari.org

By and large it makes no difference, only when someone is wanting to buy or
sell something is it a PITA. I basically assume that it's the USA if a
country isn't mentioned - basically, you can't go far wrong then.

What I would gladly pay for is a CAB upgrade that (in order):

1) handles URL redirections and cookie paths intelligently
2) features built-in 128-bit (or stronger) SSL support
3) speaks MiNT-Net sockets built-in
4) uses them to download several parts of a document in parallel
5) supports GIF, JPEG and PNG natively (including transparent PNG)
6) formats the page faster than CAB
7) is fully HTML 4.01 and XHTML 1.0 -compliant
8) supports basic style sheets (no need to be cascading)
9) optionally enable Javascript, but ignore popups

Basically, what I would like is a better CAB. It already does a lot of what I like, but has started to fall behind some sites on Javascript or complex URL redirections that Howard's CAB.OVL can not handle properly.

The SSL part might impose some export restrictions. In this case, I can offer a shell account on my second TT, if this helps you to develop it in the free world, outside Pentagon territory.

An alternative would be to use an SSL.OVL which, if found, will be used by the browser. The formats to interface the OVL to your browser could be publicized, so people who need strong encryption or fancies, or who live outside US, can compile their own SSL.OVL if necessary.

IIRC The Milan computer team are making a new browser for the Milan II
but I could not find anything about it on there website. I remember
someone posting a very small piece of info here about it. You never
know it could have everything we need.

I would be surprissed (and amazed!) if it was Flash compatible
though.......

I'll keep searching for some news about that browser....

Hello All,

Recieved my Calamus SL 2000 upgrade last night and I just installed it today. For the most part it works fine, but there are some strange things that are happening. For the most part the open title screen is blank when the program loads in. Also some of the files I created with SL 99 are alittle messed up when they load. The colored text is all ra together so it is very hard to see what words are typed in. Also, even some of the included DOC files are messed up when loaded in. All this happens under the 24-bit color mode. Now when I load in the program in the 256 color mode, everything is fine. Is there a setting in Calmus that will solve this or do I have to re-create my files under SL 2000 in the 24-bit mode?

I have a spare Lynx II for sale. I have the original box, docs and some games. It is in mint condition and works perfectly. I am willing to listen to offers for the next few days so if you are interested in a trade or purchase, please let me know. I am interested in an Atari 7800 w/games; an NEC TurboGrafx-16 w/games or a N64 system. Any trades must be for merchandise in good condition - ie. no nice N64 with broken controller. I have a nice Lynx and want to trade for something of equal quality only. No junk please!

E-mail me direct if interested.

My eye fell on a question about countries.

Why is it relevant to know where on the globe the sender is at a
certain moment?
I have a depository for files on mydocsonline. But do not know where
that harddisk resides where my data is on.
And I have a worldwide reachable hotmail adres. But where is my mail
kept?
It is only relevant to know where (I think) because of the legal
repercussions.

And further:
people here are not so much in de nation/country-stuff.
We are here all Homo sapiens atariensis, a sub-tribe of Homo sapiens
digitalis.

Which version of STiNG do you use?
We in Poland have had very like problem.
Our national operator TPSA (Polish Telecom) started to install Nortels
CVX internet access servers.
When connected to this server using STiNG, we were getting bombs
exactly 90 seconds after beginning a telephone connection, i.e. 55
seconds after getting IP number. Until this moment a connection was
always perfect, all functions were working normally.
This effect appeared on versions 1.22 and 1.26.
We have found that version 1.20 and the previous are free of this bug
and work flowlessy with CVX servers.
When trying STiNG 1.20 be careful; you have to change *all* modules of
Sting.

Hi Claes,

Thanks for the info, I seemed to have at least partly cracked it. I have managed to back up a 580Mb partition with CDBackup. It was all a question of the order of putting in the CD/initialising the burner. The whole thing seems very automatic once you get it right. I have got to mix down all my AIF files, convert to WAV before trying to make an audio CD. It's all to produce demo CDs for my guitarist/composer son. What with Cubase Falcon Audio/C-Lab Falcon and now the burner, we are almost independent!!

BTW, to recoup on the £90 for the burner, I'm selling EMagic Logic, the full plastic 'book' cased version with extra midi ports/dongle. EMagic Logic Audio is of course thrown in, plus a hell of a lot of bumpf of the net.

Bob King.

> drive "broken" - "weird" maybe ;-)

Since the standard doesn't say anything about the driver having to
initialise a drive with its parameters before being able to correctly
access this drive I don't find this behaviour compliant to the standard.
The standard doesn't say that this has to be done, so anybody writing a
driver can't possibly know that he should set the drive geometry first.
Or did you find any hint in the standard that this has to be done?
This is the same as if you would have to send a SCSI command, e. g.
INQUIRY, before being able to access certain SCSI drives. If a SCSI
drive would require sending INQUIRY first would you call this compliant
to the SCSI standard?

From: swampfox1@earthlink.net
Message-ID: <M6Jp5.390$C42.15855@newsread2.prod.itd.earthlink.net>
Source record: 58032

Hi All,
Anyone here know if a DSL connection is feasable on a stock Falcon?
Earthlink is running a special saying a DSL modem is needed (looks like
it's free).
John G.

Hi John,

> Anyone here know if a DSL connection is feasable on a stock Falcon?
No way...
You need a computer that can communicate through a fast ethernetcard (Milan)
and a stack that knows the POPoverEthernet protocol. There might be a solution
for the ethernetcard, but software wise there's no stack on our platform which
supports the POPoverEthernet stack.

Cheers from Belgium
Dennis

Thanks for this bit of info. I would not have even thought of it since
Calamus alwaysran under 24-bit. I think this change came about because the
graphics card for the Milan does not support 24-bit. The same card (Rage
Pro) works in the Hades also. I do not use the 32-bit mode much, but I will
now I quess. I setup my Hades to do 32-bit in 1024x768. Now Calamus
functions well and looks great.

From: chrisc@zetnet.co.uk
Message-ID: <39a916b3$0$18632@news.zetnet.co.uk>
Source record: 57954

Hi Foolks...

I'ev got a pair of STe's I picked up a while ago with the intention of using them as test mules and back-up for my MegaSTe..unfortunately...

When I go tthem they both had nasty cludgy boards shoved on top of the processor...one was definitely an unpleasant TOS2.06 switchable upgrade, the other could have been anything...graphics card or accelerator host, MegaST expansion slot conversion, one of the PC conversion host boards, something like that anyway....

When I removed these things to fit TOS2.06 as standard (and to clear the way for IDE hosts) the machines stopped working..

The one with the unknown board is now working...basically what I did was pull the processor out of its socket (while doing the take-everythign-out-and-plug-it-back-in technique) and noticed that a lot of the contacts of the socket were pretty bent in and can't have been making a good signal to the CPU....this is where the wierd board had been plugged...so I spent a rather boring half an haour with a pair of needles bending the contacts back out....push a needle into the top of the socket between the edge of the socket and the contact until you can get the other needle behind the contact from the IC side edge and bend it out again...Took a while to do it properly but eventually I had them all bent back out proud of the IC edge of the socket all the way round (corners were a pest) and plugged the processor back in...and waddya know ?....IT WORKS :-))

I'll have a crack at the other one soon (there are some wierd bodged on soldered bits to worry about)...if this all goes to plan then I'll have three ST's running on the stand at the AMS show in November to demonstrate stuff with...prolly try for a demo of the STe's MIDI-Synth being powered off different channels of a MIDI-3 running a program called RealTime, which is an algorithmic music generator that works with Export.....

I'd give up on the internal board for the Mega STE, as you need a new
cover and several bits and pieces to get it to fit:(It's not just a
plug in job:(

Hi Dylan,

As a fellow newby to CAF (with a C-Lab MarkX) I can just say that with 2.1GB SCSI drive and only XControl accessory, I have had no problems at all. I think the advise of a clean desktop is very true.
I have just produced my first audio CD and its worth all the hastle.

Hi Peter et al,

no as usual its my fault for the confusion. I usually reply to 'mails on seeing them without checking the facts and so often get names etc wrong. I have not got CD Recorder by Soundpool to work with my Ricoh, but have managed to use CDBackup and CD Writer OK. I tried to use CDISO first, but after wasting three CDs realised that 'Writer was the correct one for Audio CDs. All seems OK, at least for now. Thanks every one.

That's what I discovered on my french version too. I mailed immediatly to Invers and Big Boss Ulf Dunkel replied me that Calamus SL supports only the 256-color and 32-bit resolutions. He said that this is due to a bug in some NOVA/Mach64 drivers which don't handle correctly the other resolutions.

I have used to launch Calamus in 32K colors and I never encountered a single display problem in any resolution. To be honnest, when I first launched Calamus SL2000, I saw a big sign across my screen: BEWARE OF BUG! The display is correct and incorrect at the same time... I call this a little bug.

After the answer of Ulf Dunkel, I didn't really change my mind. I couldn't believe it. 32-bits! That's crazy. Besides, I have only 2 Mb of VRAM which means a very low resolution of only 640*480*32b instead of 1024*768*32K. That's a shame on an Hades.

Luckily I speak german and I'm trying to pressure Ulf Dunker in order that somebody at Invers has some mercy for my little Hades and put back the support of some "normal" resolutions into Calamus SL2000. I asked for a very special version only for me (they may have some real reasons) but if we are several to pressure Invers, maybe will we be able to let them go backward. That's definitively crazy that Calamus SL2000 doesn't even support 24-bit resolutions.

> HADES 060: 140meg Ram, Yamaha CDRW Drive, 1 gig Jaz
> Drive, MicroTek E3 Scanner, Mach 64 w/4meg Ram, Epson
[SNIP]

You have 4 Mb of VRAM, you can create some good resolutions in 32 bits. Otherwise, you can add a white frame as background for each of the pages... and the display goes back to normal. Strange, isn't it?

See you later,

Try taking off all Desk ACC's, non-esential auto PRGS, No SpeedoDos or
NVDI,or screen savers.Pretty much a clean desktop. I am not an expert
in CAF (however just got a Falcon) but sometimes Qbase in general is
picky.

well I have to update myself, and offer an apology (sort of)
I read a card that came with my SyJet cartridges entitled
"Limited Extended Warranty for SyQuest Products"
Since the back of my SyJet cartridge said there was a one year warranty,
I didn't pay any attention to this at the time. I didn't want to pay
to extend my warranty over one year!
Well, with my cartridge troubles I re-read the card, in detail this time, and
it says the cartridges are only warranteed for 30 days!!
Ooops.
So PCS/Syqet are standing by there product, sort of. Seems that they don't have
the confidence to back them for a year, but at least they do so for 30 days.
NOW I wish I had gotten that extended warranty! :-\

Steve,

Before you come back and make a statement like that you should read there web site and see what is really going on. Here is a good link to the site so everyone doesnt have misinformation http://www.syquest.com/press/index.html

This link will show what has happened to Syquest which is now called SYQT. Select assests were sold to Iomega. That is why I like many others paid $20-$30 for a Syjet(NEW in box with Cartridge). I also paid $25 for the parallel to SCSI adapter(NEW in box). I have also called and went to local computer stores who use to carry Syquest only to be told SORRY their gone.

Please stop spreading this nonsense, Dennis!

1) Not all cable-net and DSL providers want DHCP or POPoE; plain
static IP is still possible in many places, as both myself
(Finland) and SWE (Slovenia) prove.

2) Ethernet is also possible on MEGA-ST, MEGA-STE, TT, Hades.

Nowadays, there is even a ready-made cartridge adapter that
works on a Falcon: http://www.asamnet.de/~hilgarte/ether.htm

Me neither TBH!

A translation of a product such as this would be fairly useless without a
manual, which in turn takes an unbelievable amount of time!

I'm surprised that it worked! If you want to do a computer to computer link
then one has to swap the data send and return and the handshake lines over at
one end of the cable - unlike for a modem!

> An alternative would be PARCP, which uses a slightly modified printer

The software should be available from Petr Stelik's (sp) web page, a search
engine will help if you look for the name or for PARCP. You have to unsolder
two wires from one end of the cable and swop then round, then connect the two
machines via the printer ports.

Good idea, but....

First to use a PC mouse you need either Mouseburster from Mario Becroft or link it into the serial port.

Most people don't have a spare serial port so that is not the chosen solution. You could programme a Mouse driver to use the scroll function, but you'll find programmes that don't like using the serial port for mouse e.g. non GEM games.

The mouseburster can use the scroll wheel but only for a doubleclick. Therefore I suppose the Mouseburster would have to be re-programmed to send commands to the ST and a little bit of software would change these commands to an up and down movement on the scroll bar.

I always have my left hand fingers on the arrows keys (TOS 2.06 and up) so I use these to scroll and the thumb on the Enter key. Try it...

2301. Need help with setting up an ST for E-mail

Newsgroup: comp.sys.atari.st
Date: 2000-08-28 00:00:00 UTC
From: hairy.biker@ntlworld.com
Message-ID: <1eg34ql.czjx2rwv57nvN%hairy.biker@ntlworld.com>
Source record: 57978

Hi there, I have only recently started nosing around here, but I have owned an Atari for the last 16 years. My first being an 800xl, then a 65XE.

I now have a 520STFM (2 in fact, but I'm only borrowing one of them). One of them is a 520STFM (TOS1.4) upgraded to 2.5mb and an internal HD floppy. The other is a fairly base 1mb 520 (TOS1.2), with a standard 800k drive. I also have an external 800k floppy too.

At the moment I have lent mu Mum one of them to learn some basic wordprocessing on (I have a selection, from First Word to Protext 6). As it is the only spare computer I have at the moment, I would like to get it setup for E-mail.

The needs are very simply, my Mum is not going to want any knobs and whistles, just the basics - type a message, send, recive, and reply will do.

Although I did an awful lot of work on the Atari, I never used it for communications, so I have no idea of how to go about this. I use the Mac for that myself.

Presuming I am going to need some connection software - PPP & TCP, and an E-mail client, I would like to know what would be best suited to the setups I have (preferably a 1mb ST with 2x 800 floppies), and where I could download the software.

It might be handy to have a basic browser too, if possible.

Cheers.

this may have to do with partition size.
do you have one partition (1.5GB) on the cartridge?
if so maybe TOS can't see it. also, do you use HDdriver?
what TOS version do you use? that has an affect!

Yeah..
Works fine here since 4 weeks.
Connects one falcon to two macintosh. FTP server/client. Great.
Canï¿½t found a better and faster way to transfer data from one to another
machine, also CAB is surfin while datatransfer works..

<<<snip>>>>

Hi

Right first thing you need is a modem (you didn't mention if you had
one). Standard ST modem port can only get up to 19.2K but that'll be
fine for emails.

First thing is I'm not sure if TOS 1.2 is up to it, maybe someone else
can fill this in.

HSMODEM v.7 Cleans up the buggy serial port. Essential. From the
package use MFP.PRG and DRVIN.PRG.

STING v1.26 PPP connection layer. Installation can be very tricky, so
ask here for more help later on. You'll need to sign up an account on
your mac first and transport the details over to the ST.

XCONTROL v? Lets you use the CPXs (Control Panal eXtensions) for STING.

NEWSIE v0.94 or 0.96 Some people have had problems with 0.96 so best
advive for beginner is to use 0.94. This is the email, FTP and
Newsgroup programme.

CAB v1.5 Web browser thats only HTML (no Java etc) works but very slow.

CAB.OVL v1.18 lets STING communicate with CAB.

On disk one create folder called AUTO and put in this order:
DRVIN.PRG
MFP.PRG
STING.PRG
Rename STING.APP to STING.ACC and put on the root of Disk one. Put
XCONTROL on root as well and configure it to load the CPXs.
Get eveything working by putting in the details of your ISP into the
STING.SCR and DEFAULT.CFG.

Now on Disk two put NEWSIE and CAB. Set up NEWSIE with your ISP
username and password.

Download these packages of an FTP site or search about for them on the Net.

Hope that all helps, and remember, help is not that far away :-)

P.S. Docs are supplied for STING but are very daunting for a newcomer (especially if your just used to clicking on an install button and everthing is done for you!)

Greetings all,

Appart from funet.fi ftp server, are there any other good ones where I can upload Atari files to ? funet did seam ok but I've been uploading files there for ages now and they never appear (must be around 2 years of this) I can only assume funnet is no longer being maintained ? in anycase its a right pain to upload so I'm looking for other FTP servers where I can upload files to. I'm looking for reliable servers, not ones which only seam to be around for a year or 2 then vanish. That would be a bit of a bugger if I spent months uploading files only to have the server vanish. I have mailed a few servers so far, my first choice would be BT server, though they still have not replied from weeks ago, I tried demon but they said I could not upload to them (they didn't say why :( ) I've tired some other FTP's with no reply so I send a plea to Atari fans to see if they can point me in the direction of a good FTP server.

Just while I'm here, anyone got any ideas on how to transfer files accross the net, rather than download them to local, and upload them from local ? it would be nice to transfer files from one place on the net without the long process of a download-upload kinda thing, don't yell, just thought I'd ask :o)

> Is it possible as a module for CAB (if ASH lets you do it)?

Agreed!. A SSL enabled OVL for cab is what I need the most, together
with javascript support, although I think this last simply will not
happen unless there is still some secret cab development.

Dan. What about contacting the Higwire developer and establish a team
for development?. I know he said that wanted the browser to be freeware,
but a commercial or shareware version is potentially a hot selling
program. That can make a real alternative to cab for us, and if it
incorporates SSL/JS/CSS it would be actually the only alternative.

Regards.

Daniel.

Hi Dennis,
I kinda' figured a faster machine would be needed (at the very least)!
I had hoped the connection could be sped up (even if I had to wait for the
machine to process the data), especially since the Eartlink ad mentioned a
free modem, etc. Thanks for the feedback anyway!

What you like?

STinG Setup?

Urgend point is the route.tab, setting on ether_pa.stx
(over STING PORT SETUP) .CPX. ether_pa is an new driver you got with
the ethernet romport adaptor.

File transfer from falcon to mac /mac to falcon only works
with FTP server/client software. Using aFTP on falcon.
Fetch on Mac. Falcon also running an FTP server.

So i can connect the falcon from mac side via ftp.
Click on files, transfer starts. Easy

Thatï¿½s it. No more specialy settings.

Diamond back is only good if one use thr standard 8+3 FS. If one use
long filenames Diamond back is useless as it doesn't support LF.

E-backup is suitable for long filenames but AFAIK it's all German and
not supported anymore.

I downloaded Mint 1.15.5 (i think i got that right) spent hours trying
to gunzip, tar etc. Got that done and installed just Mint. Seems to
work well enough. So I got hold of Xaaes 7, got that installed
along with Thing 1.26 and put TOSWIN in as an accessory.

It slowed my STE down to a snails pace so slow that it was almost
impossible to use. Also windows when dragged would leave parts
behind, plus the OK and Cancel boxes were just black.

TOSWIN would crash quite often but it didn't seem to make a difference
if it was there or not.

Is xaaes the problem or Mint. Reading the docs makes me feel Mint is
extremely powerful, but when things like this happen, it kind of puts
me off.

CAB 1.5 says "404 file not found" when i put in that URL, but that
could be a problem with my software. Thanks for the input anyway.

I don't have a problem from Netscape. In case you did, you shouldn't
add that last period in the URL above.

Tomas

only need TOSWIN if you run TOS or TTP

> Is xaaes the problem or Mint. Reading the docs makes me feel Mint is

I can't say about xaAES.
I use nAES and nVDI, seems pretty fast, but at 4 MB with a 68000
you are pushing the limits!! :-)

There should be a zip or lzh archive of 1.15.5 available.

> work well enough. So I got hold of Xaaes 7, got that installed

There's a *huge* difference between 0.7 and 0.8.

> TOSWIN would crash quite often but it didn't seem to make a difference
> if it was there or not.

IIRC everything crashes often under XaAES, as this really is
alpha-stuff. 0.8 is a lot more stable and compatible than 0.7 though, but
it's far from being a realistic alternative to N.AES.

> Is xaaes the problem or Mint. Reading the docs makes me feel Mint is

XaAES. MiNT itself is very fast.

> extremely powerful, but when things like this happen, it kind of puts
> me off.

If you simply want to multitask GEM-programs on your STE I'd recommend
MagiC or Geneva instead. MiNT+N.AES is is quite fast even on a standard
ST, but especially N.AES requires a lot of RAM.

Can you (or any Atari user) get this to work properly with long documents? I find that it often crashes out after a few pages, and as the 'Go to page' doesn't seem to work sometimes it has to start from 1 again - same goes for printing rather than viewing. I had one 12-pager where pp.1-6 and 9-12 were OK but GEMGS crashed each time with 7 and 8 for some strange reason. Perhaps it had illos on it?

This is with GEMGS 1.2 and 1.3.

There is also another point: Sometimes people ask for help with repairs
etc - here too one needs to know where the guy/guyess lives! If local,
one can perhaps discuss things in greater detail by phone or even offer
personal assistance (as Steve has on occasion).

It doesn't fit on a floppy either. I downloaded it on my Mac, but once expanded it tales up 2mb. (Nice to know that Stuffit handles the Atari archives without any hitches at all).

That's what I need. Having trouble with links to any sites that might have any connection software though. The URL posted previously only has a download for SliK which is SLIP only. I have tried a few other links, but they seem to be broken. Is it possible they are dissapearing?

Cheers all.

STiNG must always run after MiNT. Also, if you're using such an old
MiNT-version (1.12 is 8 years old or so) you *must* also use HS-Modem,
which also should run after MiNT, but before STiNG.

> I can't get hold of oAESis so I downloaded xaAES, for real

XaAES is far from finished, but if you downloaded the latest beta (0.8) it
should look rather good in ST-High.

> me off.

MagiC is extremely fast, due to it's monolithic make.
MiNT is far more powerfull, but it needs a AES.
There is currently only 1 AES for MiNT that runs stable and correct, N.AES which is commercial.
XaAES (use 0.8!) is only for BETA testing at the moment. (It wont run TOSWIN yet)

I cant say anything about the performance differences between MagiC vs Mint/N.AES because I never ran them on the same processor type.

Yes, you can find MP3 encoders for Atari:

BladeEnc: http://olivier.landemarre.free.fr/gem/Gemblade.lzh

or on Katherine Ellis' site:

BladeEnc: http://kellis.atari.org

or on my site:

Lame: http://www.multimania.com/pmandin
I have built 2 versions: FPU and no FPU. You'll have to check the
previous ones if you don't have a FPU.

Hi Patrice,

Thanks for your prompt response, will try all your suggestions and let you know.
There's not much the ST/Falcon/TT/Milan family can't do, albeit a tad slower. I still prefer Thing/NAES on the Milan to any Windows or Mac at least as far as look and feel.

Bob King.

2354. FalconSpeed Software

Newsgroup: comp.sys.atari.st

From: phantomm@eastky.net
Message-ID: <8oim6h$nt1$1@nd.eastky.net>
Source record: 57848

Looking for the version of the FalconSpeed software above version 6.2.
The version I'm looking for suppose to allow larger partition sizes
and some other needed fixes. I do have version 6.1 and 6.2 but
haven't been able to locate this newer version that several people
have told me, was made. Not sure if someone other than the original
programmer did the upgrade or not.

I know someone out there has it. Do contact me by e-mail if you have it
or know someone who does.

Thanks,
phantomm@eastky.net

2355. MatDigiR video digitizer

Newsgroup: comp.sys.atari.st
Date: 2000-08-30 00:00:00 UTC
From: phantomm@eastky.net
Message-ID: <8oi158$gh5$1@nd.eastky.net>
Source record: 57849

I happened across a Web Page today that listed some video digitizers for the Falcon. Vidi 12 and Screen Eye were mentioned and I am aware of these. However, MatDigiR was listed as one and I've never heard of this.

If someone has some details about it, then do e-mail me.

I'd like to know if it is cartridge based or uses the Falcons internal motherboard connection like the Expose. How many colors it supports and does it grab moving color video or just color stills. Also what file format(s) does it support?

Also, I'm looking for a VIDI 12 Falcon version and Screen Eye if someone happens to have 'em for sale or trade.

Any info is much appreciated,
phantomm@eastky.net

RainBow MultiMedia 2 for the Atari Falcon 030.
Original Disk and Manual.

$30.00 Firm or possible trade for Falcon software I don't have.

E-mail me if interested. I'm located somewhere on Planet Earth USA.

phantomm@eastky.net

2357. Atari Mega ST/E, TT type keyboards

Newsgroup: comp.sys.atari.st
Date: 2000-08-30 00:00:00 UTC
From: phantomm@eastky.net
Message-ID: <8oi219$gh5$3@nd.eastky.net>
Source record: 57851

I have 3 or 4 Mega ST style keyboards here and all seem to have the same problem. Some of the keys require alot of pressure in order to register the key press.

Since I've never taken one of these apart before, was wondering what I should look for or need to replace in order to get these keyboards back in good working condition.

Are there sometype of copper contacts that need cleaning or replaced under each key?

Also, I notice that the Mega ST keyboard cable that connects to the Computer itself looks similar to a normal phone cable. Can one use a phone cable as a replacement or are they wired up different?

Thanks in advance for any help,
phantomm@eastky.net

2358. Cable for Falcon LAN port

Newsgroup: comp.sys.atari.st

ExtenDOS Gold Ver 3.2b & HD Driver 7

I have the above programmes for sale. I brought them at last years Atari show in Staffs. Due to problems that I was never able to solve, I have never installed them so are new in packets complete with serial numbers.

This cost me over £70.00 new so if you are interested, make me a sensible offer.

Many thanks...

Note that Fraunhofer doesn't exclude freeware encoders from requiering a
license.

Even if you give your encoder away for free, they want you to pay for
using their patent, at least $15,000 a year.

The author of BladeEnc, though, has come to the conclusion that the
patents Fraunhofer bases its demands on are not valid in Sweden, and
thus released BladeEnc under the LGPL.

But read http://bladeenc.mp3.no/skeleton/DL.html about what Fraunhofer
and the other patent holders think about offering binaries ...

Ciao

Thomas

The old classics. Lemmings etc. Obsession. Towers. Ishar 1,2 and 3.

>There are some games with it that seem ok.
What ones then?

>Kinda like my old amiga but with limited sound.
STs have poor sound compared to an Amiga, STE on the other hand
doesn't.

Possible uses:
DTP with Calamus
WP with Papyrus
Internet with STing, Newsie and CAB
Music with Cubase, Notator
Graphics on an ST is a bit poor
PCB design with Scooter
Multitasking with Magic, Genneva

ahhh.
over here(canada) Bell offers a ADSL service with dynamic IP address's
and PPPoE. I imagine this PPPoE is the same as POPoE you are talking
about?
in which case, I cannot use this service. :-(
oh dear.

I will get an ADSL connection here and I'm planning to buy the
cartridge port LAN adaptor. Any chances I can use this combination with
my TT?

Is STinG capable of handling this in its present state?

If not would it be a difficult task to implement this?

Btw. Ulf Andersson has released some new modules for STinG including a
new masquerade module and an "Adamas emulator"!

The Gemulator has the software to read Atari/TOs compatible drives for
transfer over to pc. Their is a free program that will do the job, a cut
down version of Gemexplorer which alow only 1 file transfer at a time;((
a bit of a bugger if you have just a few thousands files on your hard
drive!!!

I tried one briefly on my MegaSTE and i couldnt get it to work, but i didnt perservere as i already had a fast port. I'd be interested to watch this thread though as if i could get it to work i suppose i could have 2 simoultaneous connections.

If you attempt it with the MegaSTE factory fitted top then it wont work as there's no HD bracket, buying the Atari kit wins you the HD mounting. I then traded in my Atari HD-i for a link.

Hi Phantomm!

At the moment I have a US Robotics 56K Message Modem connected to my LAN port using just such a cable. (There's a trackpad connected to the standard serial port)

I use STiNG/Connect/CoMA/Motel without any difficulties. Just ensure the latest version of HSMODEM (7 I believe) is installed and select LAN from all your comms applications.

Works perfectly for me!

Regards,
Jerry

The hardware will work fine on the TT, so will the MiNT-Net and STiNG
drivers.

> Is STinG capable of handling this in its present state?

Only if you can get a static IP-address. Neither STiNG nor MiNT-Net
supports DHCP currently.

> If not would it be a difficult task to implement this?

It looks like you're already a STiNG-user, so you shouldn't have any
problems with it.

Ahh, you may be right, I think I used 3M double-adhesive tape. This stuff
is great, it sticks like hell and silence the drive quite a lot.

A PRG which would allow for the joystick to be used in place of the mouse.

Some utility to turn the Desktop 90 degrees so I can have portrait orientation instead of landscape. This would of course mean turning the monitor on it's side, but it would be useful for serious work.

A font generator program. You draw one or two letters, and it completes the entire alphabet for you.

More printer drivers.

Yet another text editor... No, just kidding... :^)

A sculpturing emulator. You get a cube on screen and then you cut out pieces from it till it turns out like a sphinx... It could also contain 3D puzzes, like cathedrals, steamliners and what not.

3D chess, 8*8*8 squares and movement in three directions for the pieces.

A correct world clock/calendar. Astronomical time (for sailing) and politically determined time ("normal" time).

At your own risk of course and power off: I've temporarily gotten sticky
keys to work by popping off the key caps and dropping a bit of alcohol
into the center and repeatedly pressing. Let dry well, right? This may
work for longer periods with a cleaner that leaves a lubricant behind
and since it's all plastic, make sure the cleaner is ok for plastic first!
Also, the larger keys are have wire clips so I'd stay away from those
unless some else here is more familiar (lost my # keypad return that
way!!!).

The Mega keyboards use real switches. Best Electronics used
to sell a replacement set of switches that offered tactile
feedback that the stock switches do not do. The STE and TT
keyboards use the little suction cups (for lack of a better
term) for switch contact. You press the key and a
conductive contact in the center of the cup bridges circuit
board traces. Falcon keyboards are identical in operation,
but different key codes are generated.

> Also, I notice that the Mega ST keyboard cable that connects to the
> Computer itself looks similar to a normal phone cable. Can one use

The connectors are RJ-11 4 wire phone connectors. However,
the wiring is "reversed" or "flipped" in one end when
compared to the standard phone cable. Does that make sense?

Ken

2397. [HELP] PC Speed installation instructions

Newsgroup: comp.sys.atari.st
Date: 2000-08-30 00:00:00 UTC
From: french-lines@usa.net
Message-ID: <8oicup$i3r$1@nnrp1.deja.com>
Source record: 57945

Hi,

Many years ago, I acquired a "PC-Speed" hardware device from SACK Electronic GmbH, which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

Hey,

I'm new to this group. Just picked up a 520St and a 1040st. Both were desktop publishing systems and include hundreds of font disks and various software packages, as well as 3 monitors (2 colour, 1 mono), a modem, a mac compatiable card with mac drive, a 5 1/4 IBM drive and emulation software, 1200bd modem a few extra 3 1/2 drives and....most came in the original packaging. ALso have a megadrive 60.

My question is this...What can I do with it? Is it worth anything? Any good games for it? There are some games with it that seem ok. Kinda like my old amiga but with limited sound.

Ideas?
Rich

Hi Martin-ï¿½ric,

>
>1) Not all cable-net and DSL providers want DHCP or POPoE; plain
> static IP is still possible in many places, as both myself
> (Finland) and SWE (Slovenia) prove.
OK.... I'll rephrase it:
MOST cable-net and DSL providers want DHCP or POPoE --- happy now? ;-)
Since you're the self-proclaimed expert, would you kindly tell us what to
do if we're so unfortunate to have a provider which insists on the above
mentioned protocols?

> Ethernet is also possible on MEGA-ST, MEGA-STE, TT, Hades.
I'm aware of it, that's why I wrote that there *might* be a solution for
the Ethernet connection to Johns Falcon. The hardware isn't the problem
it's the software that's missing.
BTW you forgot to mention the Milan 10Mbit/sec ethernet card....

>Nowadays, there is even a ready-made cartridge adapter that
>works on a Falcon: http://www.asamnet.de/~hilgarte/ether.htm
Yes and it's incredibly fast isn't it, this is just the thing what people
need for a fast cable modem connection...

>Please stop spreading this nonsense, Dennis!
I will not....
In Belgium, Holland, Germany, France, Austria and probably the UK the
only way to get a cable or DSL connection is by means of what you call
nonsense. What do you propose? should we all move and come to live in
Lappeenranta?
John asked one simple question and I tried to give him an honest simple
answer, should I have written:" go ahead, and if it doesn't work, sorry
for the costs made, toss it all in and move to Finland, send the cheque
to Martin-ï¿½ric" ? :-/

Cheers from Belgium
Dennis

How? IIRC you need the SCSI-card and SCSI-cable, what else? I sold my MSTE
in 1994, but I can't recall having any problems installing the SCSI-card.

I tested the link, and it works. But I will remove it, following
Frank's advice. Lame and BladeEnc don't have binary versions on their
web sites, so you must download source code from there, and recompile
it for yourself.

I am sorry to not provide binary versions, but it is very easy to
compile. Everybody should also send this warning to Olivier Landemarre
and Katherine Ellis.

> John G.
>.
Hi John,

wouldn't know about the corruption, bit I doubt it as ZIP and LZH is surely
a losless compression algorithm, otherwise how could it be used for data/program
compression. The main problem is I think the sheer size of WAV, AIF files, usually
10s of Megabyte. Zipping etc would only reduce by say 30% at a guese, still leaving
a file too long for transmission. I think I'm correct in that MPEG has arisen because
by being lossy it allows for much greater compression factors. I have tried it on my
Milan but the rate of processing my WAV and AIF files is so slow, that I gave up.

Bob King.

No, he didn't ask for it but as I though this was rather important to know I've mentioned the problem.
What's called important? For me LF names are a must. I never need to guess anymore what's behind a cryptical 8+3 file name

I've used Dimand Backup for quite some time myself. It's indeed a great program but as almost all my partitions are VFAT ones and beeing so containing long filenames DB it's useless for me.
Furthermore as a MiNT users I do have ext2fs partition which DB doesn't like at all.
The only backup program I know that can work with LF, ext2fs and minix partitions is E-backup. But as said this program is all German and AFAIK not supported anymore.

For tape backup, I prefer Gemar. Used scsi tape streamers are fairly
inexpensive. Have Diamond Back, but it does not like one of my scsi
streamers. One facet of Gemar is a most effective use of a nag box in
the unregistered version.

Does DB work OK with large partitions? I ask because Diamond *Edge* falls over with the 6.4GB IDE even though individual partitions are only some 850 MB - but that's too much for DE and it starts showing negative numbers for size etc. As a result I have deleted it from my disk and use HP_Optimizer instead. I still have DB and Diamond Mirror on the disk but haven't dared use them as I don't know if they suffer the sme problems.

Everest is fine as long as your lines are not over 250 characters long -
if they are it will lose one letter as it wraps to the next line. And in
case you think such long lines are unlikely, there are programs that
only have carriage returns at ends of paragraphs - I thing Pap is one!
I use Everest myself, but I do wish the author had incorporated in it
the choice to wrap or truncate overlength lines that Tempus uses. The
text editor in Harlekin 2 (was on a cover disk) also wraps overlength
lines without losing characters.

Regards, /Peter/

2428. FREE Atari Computer Catalogs! Also on Web site and FTP!

Newsgroup: comp.sys.atari.st
Date: 2000-09-01 07:40:12 UTC
From: bensmith@user2.teleport.com
Message-ID: <8onmgs$f1i$1@user2.teleport.com>
Source record: 57810
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,or.forsale,pnw.forsale,rec.games.video.atari,rec.games.video.marketplace
Body handling: HTML body converted to readable text

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/
Web info in my Signature attached to the bottom of any of my messages!

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

2431. TION] CATBOX w/ extras for $100 and 5 hours left. See details...

Newsgroup: comp.sys.atari.st
Date: 2000-09-01 08:38:38 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <0001.39afdd0d@fmlynet.org>
Source record: 57820

FamilyNet HQ: Telnet:\\www.family-bbs.net

The ever elusive (and rare) CATBOX is on bid right now at....

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=419606763

Comes with a complete Jaguar still in the box, 2 controllers, and an Atari SC 1224 which has an adaptor that connects up to the catbox. Nice unit!

The bid is up to $100 right now.

You figure a Jaguar sells for around $30 these days in the box, an Atari monitor you can pick up from a thift store for $5, so you would be picking up the CATBOX for a little over $65!! That's less than what you will be paying for Battlesphere (which is around $75+ and worth every penny too!)

The CATBOX will give your Jaguar options not previously available. Two great examples are....

1) Greater range of monitors that can hook up to your Jaguar. The CATBOX expands the existing A/V port and makes more than just RF signal TVs and video monitors available. With the Catbox, monitors with sharper pictures are possible (at least the RGB style like the Atari SC 1224, which comes with this package)

2) Connectivity to up to 16 other Jaguars! Sure the JagLink could connect you to another Jaguar. What wouldn't it be great to get more than two Jag players together for a multiplayer round of Aircars (up to 8 players possible). And there has not YET been a player session where all 16 players were connected up for a session of BATTLESPHERE. Wouldn't it be great to attend a JagFest and be able to help make this awesome event a reality? :)

What? No Battlesphere? Well stay tuned to this newsgroup, the 2nd release is right around the corner.

The Catbox was a great addition to a Jag as you can see, to which the creation we will thank ICD for. Unfortunately, it's been years since new Catboxes have been made, and people have had to trade with others as far away as Europe to get a Catbox these days. Catbox units go for high dollar amounts, and extensive trades. And yet, a Catbox is available in the states, and with only five hours on the clock!

Don't let this pass you by!

Indeed. Is the author accepting registrations? Last I heard he was ignoring
would-be customers. I'd say the software is useless unregistered.

2436. [PUB] September Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2000-09-01 11:12:02 UTC
From: Francois Le_Coat/mailaxis <lecoat@ief.u-psud.fr>
Message-ID: <39AF8F02.42196CF2@ief.u-psud.fr>
Source record: 57815

Hi,

Just a word to tell you that my WEB site is online
back again. You will find the latest September Release
of my Software Eureka 2.12.

Things are moving around OpenGl on Atari, So Eureka
moves also. There's two new graphic rendering modes :
"coloured mesh" and "Gouraud visible mesh". That's
noticeable.

For the time being, all 3D rendering are only done
by software. But we are seriously thinking about
speeding it up, by hardware means. The latest Milan
has a 3D graphic card. We expect that screen drivers
will be well done, and that hardware speedup of
OpenGl will be available.

If you have some remarks about Eureka, please
contact me. You're welcome ...

See you soon for news about ATARI world ...

Everest is certainly not perfect; the other problem I have with it
is that it sometimes interprets a slightly prolonged left button
depression as a block marker rather than a cursor positioner.

I have tried qed, Edith and one or two others but don't like them as
much.

For those interested in sending money to Dan Ackerman via Denesh
Bhabuta (see below) the postal address is:

Denesh Bhabuta
PO Box 2023
Wickford
SS12 9RX
UK

The suggested last day for money to be with him is 30th September.

Cheques should be made out to Denesh Bhabuta (whose email address is:

denesh@cyberstrider.net)

****
Hi

Saw your posting on csas regarding sending money to Dan Ackerman...

If you and a few others get together and want to send some money for him to
me, then I will gladly write a USD cheque out to him for that amount.

Please let me know and make an announcement on my behalf on csas... It
would also be nice for people to be given a deadline for when the money
should be received by me so that I can pick a day to send out the cheque.

Regards
Denesh

WTB - memory expansion card for TTmemory. Also any
video cards for TT. Has anyone converted a PC
video card (Intel) to TT yet, such as a DIY
modification. STmemory card I already have, but
it is just a 2mb Atari which I'm told may be
upgradable to hold 8mb of chips. Any encouragement
along these line w/b much appreciated. Looking to
get this TT on the 'net.

Ditto!

Would be more then willing to pay a handsome fee for this since I'm
getting ADSL later this fall and I figure that will save me some
money compared to my phonebill. The ADSL will be a fixed sum each
month, and the phonebill keeps getting larger each month. Here in
Sweden we pay per minute for the phone, so chatting and surfing for a
couple of hours, the bill gets rater hefty.

Hello!

I just acquired a Magic Sac+ cartridge with the ROMs, cable and manual. Unfortunately, the software was not included. I realize it only emulates the oldest Macs produced, but I'd still like to play with it if possible.

So -- by any chance, could someone please point me to a site where I can download the software for the Magic Sac+? Alternatively, I'd be happy to reimburse for blank disks and shipping if someone has the disks and would be willing to make a copy for me.

Thanks so much!

2454. Logic 2.5 - Fonts ?

Newsgroup: comp.sys.atari.st
Date: 2000-09-02 04:25:57 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <39b08156$0$56648$392904a7@news.execpc.com>
Source record: 57833

Hello,

A while back, I wrote to the newsgroup regarding Fonts used with
Logic 2.5
Someone mentioned that there was a program that converts
SpeedoGDOS fonts into the "standard" .FNT format.
I think it may have been a German program.
Does anyone happen to know the name of this program and if
it is obtainable with English Docs?

Or, were there other fonts with a .FNT extension made to
work with an SLM804 laser printer.
I have the standard Dutch and Swiss, but I am looking for
more variety.

Thank You.

ken

2455. Logic 2.5 chord symbols (jazz)

Newsgroup: comp.sys.atari.st
Date: 2000-09-02 04:41:40 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <39b08506$0$99052$726baab@news.execpc.com>
Source record: 57834

Hello,

In score edit mode, I click on a chord symbol and a dialog
box appears prompting for the arrangement of the symbols.

Example: If I type ===== the flat will be a "for real"
Ab7 music flat. Not a "text" flat.
=====
But if I type A7b in the same box, the b will not appear.
(looking for end result A7b5 13)
If I type A7 in the box then b5 in the next, I get
a "text" flat and not a "true music flat"

Does anyone know of a workaround for this problem.

I'd like all of my chords to look consistent throughout the score.
I can change them all to the "text" flat, but the "look" is not
as nice.

Thank you.

ken

Source record: 57836

Hi Ken,

As you know, I have Logic 2.5 too. Unfortunately I don't use it very much. I mainly use Edit Track Platinum for sequencing, and I don't often need to print out a score. If I need to do a lead sheet, I usually do it by hand. No hoops to jump thru to get it the way I want to! ;-)

The only workaround I can come up with is instead of using a sharp or flat to indicate an altered chord structure, use a plus or minus sign. I've seen many scores using that method, and actually I prefer that myself. I don't know how that would look in a Logic score, but it's worth a shot.

I'd be interested to know what you find out regarding your other posting.

Good luck,

Clayton Murray
Seattle, WA USA

GDOS fonts is what you're looking for, and in the UK the FaST Club had
a wide range in their PD library http://www.cix.co.uk/stclub

Of course there probably plenty to be found on the various Atari ftp
sites as well! :-)

2463. Re: Cable for Falcon LAN port

Newsgroup: comp.sys.atari.st
Date: 2000-09-02 11:53:31 UTC
From: jtmartin@gofree.indigo.ie
Message-ID: <%S5s5.20409$r4.10749@news.indigo.ie>
Source record: 57840

Hi All!

Sorry I didn't get back sooner: don't have as much time for newsgroups as I would like! =(

Anyway, I have had a number of queries about the settings on my machine (C-LAB Falcon MK.X) with which I am using a USR modem connected to the LAN port.

I am using HSMODEM 7 and the latest version of STING (http://sting.atari.org)

Firstly the HSMODEM settings:
Running setter.ttp on DRVIN.PRG (just to be sure:)
FASTINIT:y
EXOPEN:y

Now onto SCC.PRG
M2TT: U
M1EMU: U
LANBIT: N
LANEXT: N
LAN_S2: U
DTRM2: Y
DTRS2: Y
M2DRI: N
S2DRI: N
RBLM2: 256 \
TBLM2: 256 |These are my settings - they are not
RBLS2: 16384 |really relevant to getting the LAN
TBLS2: 16384 / to work

Next the configuration of STiNG after you have rebooted of course! ;-)

Firstly open SERIAL.STX (Serial Ports, part of the STiNG package)
Chose LAN from the port menu (this will be the default port for connections)
and setup the paramaters (I usually use 38400,8,N,1)
[SAVE] the paramaters while LAN is selected, and then click OK

Next open the dialer, and open the configuration dialog. In the last part of the dialog (under Miscellaneous) select LAN as the serial port. Save your dial.scr and you should be away! ;-)

Hope this helps,
Jerry

the above is a good idea but:-

This would be the same Denesh that I sent money to last November for
Aniplayer and IPRN registration. Below is my last email which I only
sent yesterday so I may still get a reply.
John

Hi Denesh I saw the post in the newsgroups and thought wonderfull
idea but any chance of my key or send the money to France and I get
my key from there (for Aniplayer) and the money for IPRN send to Dan
thanks John sending again

I've sent money all over the globe directly where it needs to go,
even cash a few times. I never had a problem and the "middle man"
approach tends to be problematic, and slows the transaction down.

Can anyone help me I'm looking for the cable to connect an Atari
1040st to a SH204 harddisk. I guess I will have to make a cable.
What I need to know is the pinouts of the two devices. Does anyone
know where I can find this information? Is it just a pin 1 to pin 1
etc connection?

Chris

Lot's of luck. I don't think Dan would ever see the money. Denesh ripped me off for my Aniplayer registration last year - never got a key despite _numerous_ e-mails and his empty promises. Fortunately Didier Mequignon himself sent me a key for some "trouble shooting" I did for him - however I don't think he ever got the money I sent to Denesh either.

I'd much rather send Dan some money directly.

Doesn't Freei.net _require_ their proprietary add banner software to be running in order for you to use their dial up access - and therefore require the use of the Windows or Mac platform?

How'd you "trick" Freei.net into working without their software??? And would you mind e-mailing me the STinG DIAL.SCR file?
;^)

And speaking of that, please send me an e-mail Charles since I have a couple questions for you, and your address I had from the past appears to no longer be valid. And all I see in this post of yours is your SPAM-Blocking address.

Send it to:

nurmix@1nol.com -or- nurmix@socal.com

Thanks,

-Paul

I haven't had any trouble with bombing like that with either 1.20 or 1.22 -
as they both worked well with my current "pay" ISP. I'm having a little
trouble configuring it to work with the free ISP I mentioned in my previous
post, but this is no doubt to to a misconfiguration on my part, not a
problem with STinG itself.

Thanks,

Hi

Some of you may have seen this in the journal of TT-Digger & AHCX

I thought it might be nice to give it to the public.
Basically because it is only in dutch.

I didnt want to translate it myself, because the naturality of the language is essential. Also because of differences in sentence order in languages it may be necessary to change the programming of the little generator.

So you can find it on my homepage (in sig) both as a ACC and source.

Because everybody understands english I need a english programmer who understands dutch to make the first translation. Then it can start conquering the world.

The stuff that needs translating is in TTIJD.C

I believe some problems might occur because you partitioned the drive
with ICD...
I know a guy who did just that - and when he changed to HDDriver, there
were some large partitions which didn't work correctly with HDDriver (or
with AHDI for that matter), but after re-partitioning the disk with
HDDriver it worked perfectly. The reason is that ICD isn't fully
AHDI-compatible (I'm sure Uwe Seimet will verify this) and that's one of
the reasons I never recommend ICD to anyone. HDDriver is simply better
than anything else - so why go for second best...?
I believe you should partition your drive with HDDriver's utility
program and you'll be back in business.
I never had any problems with CAF on my Falcon and I used HDDriver for
several years.
To get CAF to work as best possible, you should set the cache settings
down to the minimum setting of 2 in the HDDriver setup. Also, set your
HD to use only Read cache - and not Write cache, as this setting is
safer...

Another possible cause of your problems is if the CPU clock modification
hasn't been correctly made - or that your Falcon needs another
modification than the one that's been made. Then similar problems might

occur. Check my website to see the alternatives (3 different ways).

Best regards,
Claes

Hei All.
I was reading the recent replies of ng abuse, for which I was curious on a novice
it may seem. How do they manage to carte blanc over the various newsgroups. To cover
widespread seem access is very easy. What means can do this and is it preventable.

On another note I pop across to French version of Atari newsgroup and I noticed the
subject of WenSuite 4 occassionally mentioned. Is there some progress in this department
and would there be a release date in the near future.
Is there a german atari site well,
if so what is it's address.

Regards.

2485. Digital Antic Project - 8 new issues

Newsgroup: comp.sys.atari.st
Date: 2000-09-03 06:55:24 UTC
From: Kevin Savetz <savetz@northcoast.com>
Message-ID: <savetz-E82EB6.23552402092000@news.northcoast.com>
Source record: 57766
Cross-posted to: comp.sys.atari.announce,comp.sys.atari.8bit,comp.sys.atari.st

We've added the full text of eight issues of Antic magazine to
the Digital Antic Project. Here are the latest additions:

July 1983 - Vol. 2 No. 4 - Computing: the New Adventure
September 1986 - Vol. 5 No. 5 - Weather
February 1987 - Vol. 5 No. 10 - Word Processing
March 1988 - Vol. 6 No. 11 - Video Game Shootout
July 1988 - Vol. 7 No. 3 - Newsroom Comes To Atari
June 1989 - Vol. 8 No. 2 - Diamond Cartridge
October/November 1989 - Vol. 8 No. 6 - Money Magic!
February/March 1990 - Vol. 8 No. 8 - Atari Recorder

Our next project will be to get the full text of STart magazine online:
if you're an ST lover with a scanner, OCR software, and some time to spare,
you can help. Send e-mail to savetz@northcoast.com.

I also need to find someone with an expertise in ST file munging and the
ability to move STart disk files from old ST disks to the Internet.

: Thanks John

I have done some preliminary work on this. The server already works fine,
but of course the client is where all the work lies. However Freeciv is
nicely designed and if someone has the time it should not be very hard. I
don't know if I will ever finish it, but someone else who wishes to take
on the project would be welcome to all of my notes.

>I 've an old 1040 ST . After switch on everythings seems ok but arrow
>cursor don't move .

You can check whether the ST is working properly by using the keys Alternate
and the keyboard arrow keys together to move the cursor around on the desktop
(Insert and Alternate together is the same as a double-click, Alternate, Shift
and arrow keys together move the pointer in smaller steps).

If that works OK then most likely all you need to do is take the keyboard out
and resolder the pins of the joystick/mouse connectors.

Yes, it was me. I was mostly trying to get an interesting thread
started, but also looking out for ideas.

>the docs for LicomLib from RGF Software translated.

The big problem with translating docs is the amount of time that they
consume!

And in this case, I dare say that LicomLib is a commercial product long
since defunct?

>these docs would help greatly. It would only require the
>HYP be translated since it's not a full program per say.

What I'd be inclined to do would be to decompile the HYP back to its
source text and run it through the translator on the Systran website.
(Probably the easiest way would be to run the text through a text->html
converter and post it to your website, passing the URL to the translator
engine). That should give you enough to get the gist of what's going on.

From: Oliver Fischer <gollum1@my-deja.com>
Message-ID: <8p2ff8$3da$1@nnrp1.deja.com>
Source record: 57773

I purchased an Epson Stylus 480 about a week and a half ago, and the
printer refused to print from the majenta ink, and I had the printer
replaced, I received the replacement yesterday. Didn't do much good
though, it was worse than the first cos the stupid piece of crap
wouldn't even let me put the cartridges in using the ink cartridge
replacement utility, it said the printer heads could not be moved.

So until proved otherwise, I believe the epson stylus 480 doesn't work
in 95, 98 or 2000 either !

Yes. You can forget the 480. That one is not usable at all without
Windows95/98/2000.

Where are you? STEs are worth different things to different people - I'm
always looking out for machines as backups, but having already got one,
I don't need one that badly!

Are you in the UK?

WTF is he?.

>Some of the dialog boxes are too wide - one actually disappears off my screen
>at both sides at 800*600!

I dont get that low these days, i'm used to 1180 x 880, but some of those dialogs 2/3rds fill my screen!!.

>The main dialog texts need editing to make the button text shorter so that the
>objects can be shrunk in width.

I'm only going by what ive seen of this demo and the glimpses i grab of yours, but they are basically shitte.

>The Printer dialog has a shortcut underline which is divorced from the actual text,

I cured that in this demo, the problem is in the binary, not the RSC.

>and the user-defined colour selector displays only various dithers in grey!

I heard that being blamed on various graphics cards, mine is definately an odd one and those buttons are broke here.

Thanks, Thomas, for that correction. I was only referring to Everest's
tendency to <delete> characters after its line limit, which mucks up
the path and other references. Edhak doesn't do this, even when it wraps.

Cheers,
Charles.

Hi Ekkeherd,
As has been stated in this thread, basic phone service varies in the
USA but the key words are "Unlimited Local Calls" included in the basic
service! This still is only half the story since an ISP must be found
that gives a local or 1-800 type free number to call! So if you live in
an area with no ISP providing a local number, you're stuck with long
distance rates from 5 cents to 25 cents a minute (and higher) as in the
good ol' BBS days!!!

What kind of software do you have? Also, what kind of monitors? The Atari ST was the first computer I ever used, and in my opinions, one of the greatest ever made. I've been looking to get a new one for a while, as my old pair of 520s were 'donated' to my half-brother, who promplty destroyed them. What a pity. Anyways, I'd be interested in hearing what you've got, and maybe working out a deal.

Thanks,

Patrick Moore

Source record: 57704

LA>Just been over to http://www.woller.com and seen some new news about a
LA>TV card for the Milan. The software (and hardware I suppose) is
LA>called GEM TV and at V0.24, so it's in its early stages.

the stand alone Software is nearly finished ... at this point we're
working out drivers ... and the delivery of the first cards starts this
week ...

LA>There's a screenshot that looks promising too. IIRC it costs 398DM
LA>with software and hardware card. It doesn't say whether it's for the
LA>Milan II but I would assume so; it just says "for the Milan".

if the Milan II will come available, it should work there too, because our
developement is using also the Milan I 060, this machine is not far
from the promised Milan II design ...

LA>Looking at the screenshot it looks like it uses Aniplayer for the
LA>sound (bottom left). I think that's a very good idea.

for the sound we use our MilanBlaster-Card ... this screenshot
should show, that it will be possible, to view TV or video and
play MP3s at the same time ... without lost frames or something
like that ...

with best regards, Konstantin

2528. ase read - Buyer Beware] Digital Data Factory (Edward Williams)

Newsgroup: comp.sys.atari.st
Date: 2000-09-06 09:15:24 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <0003.39b6748d@fmlynet.org>
Source record: 57702

FamilyNet HQ: Telnet:\\www.family-bbs.net

[Please read - Buyer Beware] Digital Data Factory (Edward Williams)

To the Atari community,

It is with a heavy heart that I give the following message. I normally like to stay fairly upbeat in my writings, but I feel it neccessary to warn many good Atari hobbyists and users of a wolf in lamb's clothing in our midst. This message comes after 16 months of broken appointments, and broken promises reguarding an agreement on an Atari item.

It was over a year ago that Edward Williams was accused by someone on the Atari 8-bit newsgroup of being little more than a thief. I stood up to defend his honor since he was a fellow member of AUNT, and a long time Atari associate from back when I was into Atari the first time around back in the 80's. I must now sadly apologize for my stance on his behalf.

Information on this individual is as follows:

Digital Data Factory (Edward Williams) 200 Crestview Dr Apt 62
Jacksonville AR 72076-4068
USA
(501) 985-2082
Used hardware
Repair Shop.

(This information found online at...)
http://www.faqs.org/faqs/atari-8-bit/vendev/

Mr. Williams was notified on August 3rd that this message would be sent to all Atari channels if he did not return the Atari item we had agreed on for him to work on. Naturally a few additional days were given to allow for labour day and the postal delivery day in case he sent it by mail.
And as said before, the firm deadline I placed came after 16 months of many arrangements made, missed appointments, packages that were promised on being shipped, you know the drill.

I have been an Atari hobbyist and trader since November of 1998. Made many transactions, met many people. I like to fulfill my trading transactions with quickness and efficiency. When I came back from my nine year absence from Atari computing, it was good to see a familiar face like Ed's. He and I go way back. It was fun hanging with him and AUNT. His actions seemed sincere enough then. I'll remember that part fondly.
But for some reason he has chosen not honor his deal with me, and from what I've seen I am not the first.

I hope that my actions on the newsgroups are respectable enough that you will know I would not post this without just cause.

My thanks to the other good folk here that make this hobby such a blast. It is for your sake that this letter was written.

Sincerely,

Greg Goodwin aka "Doctor Clu"

Maybe the user sitting in front of the library's computer
isn't paying anything, but somebody is. After all, the
library paid for those computers and the internet access.
And where does that money come from? Your taxes, my friend,
your taxes. So if you are paying $0.00 for the service, it
means someone else is paying for you. And the email
services are not free either. Since you are not paying for
the email service, then advertising is probably picking up
the cost. And the advertisers get their money by selling
products to you. So the cost of a product is higher
(probably marginally, but higher none the less) in order to
pay the email services fees. And the user gets to sit there

and look at these ads before they can start using their
email.

> month and its a local call no hidden charges or minute charges. The
> states are California,Arizona,Nevada, and Oregon. What a deal for me I
> have family in 3 of the 4 states.

But here you assume the options you have for phone service
and calling plans are available universally throughout the
nation. I can guarantee you they are not. In fact, 800 and
other toll free numbers are not universally available
throughout the nation. How many people know that? A
company can limit the area of coverage for their toll free
numbers, and in some cases a toll free number is not
available due to the phone company that owns it. And
sometimes, toll free numbers are just not available in your
area period. Been there, done that. <G>

But the whole point is, there is no free lunch. Somebody is
paying somehow for anything that free. That is the reality
of it. Making people think things are truly "free" is a
great marketing feat. Worth of Bill Gates' efforts. <G>

I realize we are straying from the subject of the Milan
itself, but...

I've always maintained that the platform should really have
no effect here. What the user would need is software that
can read other software's files.

Take Papyrus 8 for instance. They say they can import MS
Word documents. To a certain extent, they can. And export
them too is my understanding. If this feature was rock
solid, then who cares what platform it's written on? The
important part is that the information could be exchanged
with no problems. You would have to have documentation that
states what features of your program is also available in
the other program, and the importing and exporting routines
would have to properly convert those features. So, since
Pap does not support individual cell outline differences,
and MS Word does, those routines would have to account for
that when both importing and exporting files.

The same goes for all other software. It's not unlike a
graphics program being able to read and write different
graphics file formats.

Ken

Which dialogs are those? I haven't yet seen any that are too big for
my 800x608 screen, and I've done extensive testing of as many
functions as I can find in Papyrus.

>>The main dialog texts need editing to make the button text shorter so that the
>>objects can be shrunk in width.
>
>I'm only going by what ive seen of this demo and the glimpses i grab of yours, but they
>are basically shitte.

The only dialog problems that I've run into, as you've mentioned, are
texts that are too long and either run off the edge of the dialog box
or the button.

>>and the user-defined colour selector displays only various dithers in grey!
>
>I heard that being blamed on various graphics cards, mine is definately an odd one
>and those buttons are broke here.

Works fine on my Falcon. Must be a problem with different cards.

I've personally been quite impressed with *most* of what Papyrus has
to offer, although there are the occasional minor bugs. My biggest
issues have been with the quite slow speed and inadequate word search
routines of the spell checker, and that the Search/Replace option
misses the text you originally highlighted when you select "Rep.
All". Other than what I've mentioned here, I've seen little or no
problems.

GEMAR is a fantastic piece of software, possibly with no competition, making it expensive. I'd love to register my version 3, but the price is too high, so i do a backup with version 3 and any restoration with a version 2.x. V3 writes long filenames and V2 will happily restore them.

>WTF is he?.

Which "he" are you referring to ? Ulli or me? If it's me, I'm here. If
(as I suspect) you mean Ulli, then he'll doubtless reply soon enough as
long as WTF doesn't mean what I think it means !

>>Some of the dialog boxes are too wide - one actually disappears off my screen
>>at both sides at 800*600!

It fits the screen O.K. for me in 800x608, but not in 640x400.

>I'm only going by what ive seen of this demo and the glimpses i grab of yours, but they
>are basically shitte.

That's a bit strong. There may be some problems, but give Ulli a chance
to sort them out. He was been very active on this group before his
holiday and no doubt will be responding to these problems soon. I for
one am delighted that he is still developing and supporting major
software for the Atari.

I also suspect that the Demo versions may not reflect all the changes
made after the beta-testing period. I alerted Ulli to several instances
of text which didn't fit the boxes, and all of those were corrected
before the first public release. We have also had 2 or 3 updates since
then, each with various improvements.

Cheers

Paul

2538. Help : 520 STe don't morks

Newsgroup: comp.sys.atari.st

I have one Atari 520 STe brought by a friend of mine with 1 mb (four 256KB ram) . Then , he change it with four new 1 mb ram . Then again the floppy drive fault (but all the rest were ok) . So he dismount two ram (leave on the Atari only two 1 mb ram) and give it to me .
Now I tried to use it but the screen remain completly black (the same monitor on another ST is ok ...).
Should be possible that this model needs all the four ram slot full ?
Some suggestions ?

Many thanks in advance

2544. Stacy hard drive problem

Newsgroup: comp.sys.atari.st
Date: 2000-09-07 00:27:30 UTC
From: Des Tang <dest@edmc.net>
Message-ID: <Pine.WNT.4.10.10009061826040.-373451@dragon.edbd1.ab.wave.home.com>
Source record: 57720

I have a Stacy 2 with a Connor CP3020 (20MB drive).
After installing HD Driver, the hard drive seems to be missing.

I had AHDI (not sure which version). I installed HD Driver 6.22 in order to back up the Connor to magneto-optical (MO) disk. HDD did not see the MO even though I tried different SCSI Id and termination. I manually configured HDD to check all SCSI and ACSI ids (1-7).

Now when it boots from the hard drive, HDD comes up and there is a long delay (as it checks each ID I presume) then it finds the Connor drive but it does not continue to boot from it. ID Check does not find the Connor either.

I tried booting from floppy with HDD, ICD and AHDI. But the Connor is not seen by any one of these.

Any advice is welcome.

Thanks
Des

Hi

The 4 inch drop is a last resort, it has a 50/50 chance of reseating the
chips:(

Your best bet is to remove the casing, the keyboard, disk drive, PSU and
shielding and gently press down on the socketed chips they usually give
of a creak or two, or even better remove and replace the chips
themselves.

Hi

The machine should work with a half a meg of memory in it. The only
thing I could think of is that the memory is in the wrong memory bank!

The ones that should have memory in are, from the back of the machine:

< first slot memory>
< second slot empty>
< third slot memory>
< forth slot empty >

It wouldn't hurt sticking another 2 meg, filling in the empty slots,
it'll give you more memory to play around with:)

Editing dialog boxes does take quite a time (as I well know), so hopefully
some time is being taken for consolidating the package in the light of what

is being discussed here. I haven't taken a look at the dialog boxes in
question yet, but a change to the button texts to read "This", "All",
"Cancel" would most likely do the trick without the need to repeat in the
button text what is already in the dialog text!

But yes, it's really good that Papyrus is still being developed and is
readily available World-wide! :-)

Hi Paolo,

>I have one Atari 520 STe brought by a friend of mine with 1 mb (four
>256KB ram) . Then , he change it with four new 1 mb ram . Then again
>the floppy drive fault (but all the rest were ok) . So he dismount two
>ram (leave on the Atari only two 1 mb ram) and give it to me .
>Now I tried to use it but the screen remain completly black (the same
>monitor on another ST is ok ...)

I think you have to put the SIMMs into slots 1 and 3 (so that leaves the
second and last positions empty).

2554. Re: Foul Language on this NG

Newsgroup: comp.sys.atari.st
Date: 2000-09-07 10:15:07 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <05qbY9Irq2t5EwQh@lovecraft.demon.co.uk>
Source record: 57729

Once upon a time <8p6qmj$eg0$1@perki.connect.com.au>, Mark Bedingfield
<mark@baypc.com.au> grabbed chalk and scrawled:
>Girlfriend in english means, emptier of wallets, and creator of headaches.
>Why did I get married?

Ah, you see, the upgrade package to Wife includes special routines which
take over money.dll, time.dll and introduces a new TSR, nag.tsr.

Answer? Download beer.exe and hide in the Pub.

laughs
Richard, whose girlfriend isn't like that.

Well, I tried to take it apart. You almost need a blow torch to get that
shielding off. :-)

Out of desperation, I tried the "8 inch drop" and it worked! I've rebooted
it about 20 times since and its come up each time just fine. Now I can
finally get back to the serious business of playing Stunt Track Racer.
:-)

Softjee announce to Atari user a new service : http://store.softjee.com
allow you to buy Softjee software online !!!!

***** products list

Softjee pack is composed of all the better audio software from Softjee on
Atari Falcon. In the Softjee pack you have : DHS, Audiomid, Easy Beat, Devil
Studio, Expand 2, Pretty and Midplay !!!. Free shipping, paper documentation
+ disks

Audiomid convert audio data to Midi data !! (Atari). Free shipping, paper
documentation + disk

Devil studio. A midi sequencer for Atari Falcon. Free shipping, paper
documentation + disk

Digital Home Studio the better audio tracker on Atari Falcon. Free
shipping, paper documentation + disk

Digital tracker Atari the little brother of DHS. Free shipping, paper
documentation + disk

Easy Beat compose easily rythm with audio sample on your Atari. Free
shipping, paper documentation + disk

Expand 2 a virtual sampler on you Atari Falcon !. Free shipping, paper
documentation + disk

Midplay, play midifile without any external hardware except your Atari !.
Free shipping, paper documentation + disk

Pretty is a cool midi player for your Atari. Free shipping, paper
documentation + disk

2558. List of Atari-Midi Apps now Available on TAMW

Newsgroup: comp.sys.atari.st
Date: 2000-09-07 17:13:36 UTC
From: Tim Conrardy <tconrardy@hotmail.com>
Message-ID: <8p8ibb$1hs$1@nnrp1.deja.com>
Source record: 57733

Hello All:

I decided to take an inventory of the Atari-Midi apps on my site that has become freeware.

Tim's Atari Midi World http://sites.netscape.net/timconrardy/index.htm

So for the Record:

M : Intelligent Music : Eric Ameres/David Z.
RealTime : Intelligent Music: Eric Ameres
Midi Draw : Intelligent Music: Frank Balde
Master Tracks Pro: Gvox
Tiger Cub : Dr T music: Emile Tobenfeld

All Caged Artist Editors : Bob Melvin:

4-Op Deluxe:Editors for Yamaha Tx81z,Fb01,and other 4 op Synths
DX Heaven:Editor for Yamaha DX7, TX7 and other 6 op synths. MPE Compatable version
DX Heaven:Editor for Yamaha DX7, TX7 and other 6 op synths.Early version before MPE.
CZ-Rider: Editor for Casio CZ series
K1-Edit: Editor for the Kawai K1
K3-Edit: Editor for the Kawai K3
K5-Edit: Editor for the kawai K5
MT32: Editor for the Roland MT-32
D110Edit: Editor for the Roland D110,D10 & MT-32
M1 Edit: Editor for the Korg M1
PCM70: Editor for the PCM70 effects unit.
Matrix 6 Editor for the Oberhiem Matrix 6.
Proteus Editor for the EMu Proteus

Ludwig : Hybrid Arts : Tom Bajoras
Easy score Plus : Hybrid Arts: Tom Bajoras
Gen Edit: Hybrid Arts:Tom Bajoras
CZ-Android : Hybrid Arts:Tom Bajoras
Editrack : Hybrid Arts (includes beta versions)Stefan Daystrom
TuneSmith: Jim Johnson
Decitala Rythms for KCS : Chas Stoddard
Midi Master Drummer : David Snow
Music Square : David Snow
Music Box : David Snow
Copyist DTP : Cris Sion
Fractal Music Composer 2 Demo : Hugh McDowell

Plus Cubase Mixer maps and Setups for Cubase.
Music Mouse (by Laurie Spiegel) Atari version availablilty
Omega II KCS Availability (Emile Tobenfeld)

Also available:
Midian
Robobop
Dumpit
Kanmidi
Sonus sequencer

More on the Atari-Midi File Section LINK as well.Apps that I have not had time to put on my page such as DUTCH atari-Midi apps and more.

I would love any comments about useage of any of these apps.

Tim Conrardy

I would like to invite anyone of you to the Atari-midi mailing list.

Frank,
That's the address Dan gave me after he started this thread so he'd
have to correct it for us! It was pasted from his E-mail so it was
accurate. I'll post it again here (corrected or not) as soon as he
responds. I'll be looking to see if mine gets returned also!!!
He's also mentioned that his NG server is deleting posts faster than
he can respond to them!!!
John G.

Define "any relevant platform". If you look at things like that, there is
only one relevant platform. I don't look at things like that. How can
anyone even hope to succeed, if they had thoughts like that?

Regards,

Odd Skancke - ozk@atari.org - http://assemsoft.atari.org

2563. Games question

I gave my old Atari ST to my mother and I want to teach her how to use it.

I thought the best way to get her started would be to let her play some games that she already knows (like Soitaire, Tic Tac Toe, etc.).

Are there any websites that have simple games for the Atari ST that I can download?

Bill

Yep. You'll need a special tool called.............a Screwdriver!
What do you mean you need a blow torch! Are you a Pyromaniac??!!

Take out all the screws, lift the motherboard up a little from the
front and remove PSU and shielding.
Did you have problems with the shielding going around the ports on
the back?

>
>Ah, you see, the upgrade package to Wife includes special routines which
>take over money.dll, time.dll and introduces a new TSR, nag.tsr.

>Answer? Download beer.exe and hide in the Pub.

One of the reasons i'm single again is that wife.exe kept destroying beer.exe and
also denying access to pub.app. No amount of clothing.rsc, chocolate.rsc or
jewelery.rsc upgrades would cure the problem of spurious missing beer.exe.
The only answer was to erase wife.exe, after carefull thought i decided not to
delete wife.exe but to move her off the system, but it kept reloading, so i
eventually found its entry in system.reg, changed its name, renamed it too
slag.exe and its stayed with the new users ever since.

Although it still leaves legacy problems on my personal system, CSA.exe keeps
stealing resources, to the extent that the system sometimes has no energy to run due
to a total lack of wonger.rsc causing automatic deletion of food.rsc.
Also child processes still run in my environment consuming huge processor time and
deleting system resources.

!!! Fuck the CSA !!!

As a former Amiga owner, I take offense to that! :-)

I think the Amiga was a better game machine mainly because of its superior sound. However, graphic wise, many of the ST games are virtually identical to their Amiga counterparts.

I chose to get a used ST over another Amiga because I always wanted an ST (always been an Atari fan, own several 8-bits) and it was a lot cheaper than a used Amiga! :-)

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/
Web info in my Signature attached to the bottom of any of my messages!

am swamped and I find it hard to keep up with reading the NewsGroups.

Wanted: Mega ST4. Willing to pay up to $100 U.S. Read on if interested!

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

It will also depend on what type of hard drive you have in your Atari.If it
is a SCSI drive then you will need a SCSI card for the PC before you will be
able to connect the hard drive up.You should be ok with IDE drives though.

2583. Soundpool denoiser & audiomaster

Newsgroup: comp.sys.atari.st
Date: 2000-09-08 07:34:02 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <39B8966A.849FFC40@siemens.at>
Source record: 57656

Hi,

The problem I have with audiomaster is that when I raise sample
loudness a few db I get strange noises added (not like normal
noise that naturally has to be louder too, but more like like
clinking as if some samples would have been mixed). When I use
the denoiser I get a similar effect (as if it would not substract
the noise of a 'quiet' passage but that of another song).
Is there anybody with experience with denoiser and/or audiomaster
who could tell me whether this is a common problem or rather
something wrong with my system or how I use it ?

thanks
Gerhard

Don't talk to me about Ameaba's. My ex threatened to walk out if I
bought a Falcon, so I had to go with the A1200:

2 meg ram, running around 14mhz (available speed) COULDN'T do an A4
sheet of plain ascii faster than a bog standard HALF meg STFM. And you
couldn't even turn the A1200 off while it's printing without resetting
the printer....

I had 2 setup's side by side and with a 1 meg STE using calamus the
A1200 could only print 25% of a A4 sheet with graphics!!!! while the
Atari could do several.

Amiga's where OK for games. Atari's idea was 'why mimic a Korg etc..
when you can have the real thing attached!!!'

Source record: 57659

Hi all,

I've just bought myself a Seagate Barracuda ST15150N 4.3Gb drive - and it's driving me nuts!

It's inserted into a SCSI chain from my Falcon which has (in physical order), CDWriter (ID2), CDROM (ID3), the Barracuda (ID0), Syquest EZ135 (ID1) and finally a Microtek scanner (ID6).

Everything else works just fine, HDDriver both recognises it at bootup and with a bus scan and lets me partition it, jinnee allocates it a drive letter but it just "boings" at me if I try to open it!

I've tried it with and without parity enabled, and it works just fine connected to my laptop computer!

Any words of wisdom please?

what would compatible with a relevant platform?
what is a relevant platform?

what is BeOS, LiNUX, Windows, UNiX, MiNT, MAC,...?
by platform, do you mean hardware, software, or both?
TOS/Magic/MiNT is more relvant to me than Windows, so I guess it is a
personal thing.

what is compatible?

the TIF files I create in DA's Picture are compatible with Adobe
Photoshop.
the RTF files I create in Papyrus are compatible with MSword.
the HTML files I create in Joe/webpage wizard/UDO are compatible with
Netscape.

hard to say Uwe, hopefully Axro, GmBH Milan, etc have done their market
research
ad their is a market _OutSide ;-)_ of atari enthusiasts for the
Milan2...

Actually the computers were donated to the library and the internet service is also donated to our library. And who cares about advertisers? I could care less that there maybe a 2" square box with rotating ads in the right hand corner or that a banner keeps changing. People who use these services could care less as long as they get accomplished what they need to do. Obviously there not going to click on a ad since they cant afford to. If you want to spend 10s of thousands of dollars on putting a banner on a page or in a email system go for it. I wont be clickin and you wont we advertising for long or youll go broke like the rest of the fool.

Of course who doesnt know that. If I was a Plumber that lived in Yuma Arizona and had a 800 why would I want people from NY to call me about a plumbing problem?

>

If Im getting it free from Joe Blow why should I care how much he paid for it. I got it for free. Yes I know everything about taxes and yes some places use this money to buy computers and internet service and other stuff needed in the community. It all comes down to somebody is going to be able to use a computer for no cost to them and get email for no cost to them and hopefully they can better them self while using the computer and the internet service.

Don

BTW, this was not produced by any free service or free computer I pay good money for my service and my computer just so I can stay online all the time and have a good computer. :)

I do understand what you are saying Ive mad the same points to people that used FREE PC and now look they dont have any internet service. I just thought I would argue the other side :)

But whoever donated the equipment paid for it. And to pay
for it, they charge customers or simply have a job. And the
internet service is paying for the time donated, so they are
paying for it.

> And who cares about advertisers?

Well, if you are in a remote location, and have to pay for
long distance charges to connect, you better believe you
care! Unless you like watching the phone bill climb as
those banners you have no interest in get displayed before
you get to what you want. <G>

>
> Of course who doesnt know that. If I was a Plumber that lived in Yuma Arizona
> and had a 800 why would I want people from NY to call me about a plumbing
> problem?

Believe it or not, a lot of people don't know this. Ever
seen a phone co. ad that talks about a toll free # and in
the same breath says it's not necessarily nation (or even
world) wide? And that the fees are different? And that if
your provider is Phone Co. A and someone who uses Phone Co.
B may not be able to access your 800 # even if he lives just
50 miles away? I've not seen this, but I've experienced all
the troubles in using 800 #'s I've mentioned. It was a
royal pain, especially the last case since the company
advertised nationwide support.

> If Im getting it free from Joe Blow why should I care how much he paid for it.
> I got it for free.

Because Joe Blow might be the above mentioned plumber, and
have you hired him lately?? <G> After all, he's got to
cover his expenses somewhere.

> Yes I know everything about taxes and yes some places use
> this money to buy computers and internet service and other stuff needed in the

I think this is a good thing to do with public money,
actually. It's just never really free, that's all. I know
that Clinton made a statement about getting everything
connected to the internet in one of his State of the Union
addresses, and I told my friends that this would never
happen, since not everyone will ever have access to
computers until they just as publicly available 24 hrs. a
day like ATM machines.

> BTW, this was not produced by any free service or free computer I pay good
> money for my service and my computer just so I can stay online all the time
> and have a good computer. :)

Ditto, except I'm getting P.O.'ed at my Windows box here.
I'm going to have to take the time to completely reinstall
Win 98 and my software. It's amazing to me that Windows can
install a program, but can't successfully uninstall it.
Ever since I uninstalled a piece of Lotus software after
installing it about it 2 years ago I've had one little
problem after another.

> I do understand what you are saying Ive mad the same points to people that
> used FREE PC and now look they dont have any internet service. I just thought
> I would argue the other side :)

That's ok. <G> My Dad once told me about a school board
member that always argued the minority side. The member's
opinion was that someone always should play "devil's
advocate" so issues could really be dug into.

Ken

2590. Re: WTB: Atari STacy

I wouldn't give up my STacy for anything! She's been suped up with a larger hard drive and a 1.44mb floppy disk (and four megs or RAM). I built a custom cigarette lighter auto adapter so I can plug her into the car (when I'm not driving!) and she's given me years of great service. The only thing I want to do eventually is put a new screen in her since it's starting to get a little faint.

I wonder why that is... Many early Amiga games were ports of ST games, so they would look the same. They were usually crap as well! When they started coding on the Amiga first, the games looked (and sounded) much better. Compare the really good looking games on the Amiga like Shadow of the Beast and Leander, SOTB looks like 8-bit game, but Leander looked OK, but much of the graphics were removed in order for it to run on a ST.

What program did you use? Many people leave their computers ON when they
are using it for something!.

> I had 2 setup's side by side and with a 1 meg STE using calamus the
> A1200 could only print 25% of a A4 sheet with graphics!!!! while the
> Atari could do several.

I also have a A1200 and a 1MB STFM, and the A1200 (and even a A500) blows it away in
every aspect. I'm sorry but, if I was a Atari owner first time 'round I would have known
I made a BIG mistake. I wouldn't bother trying to defend a machine that is
technically inferior.

> Amiga's where OK for games. Atari's idea was 'why mimic a Korg etc..
> when you can have the real thing attached!!!'

Well the average user wouldn't have a keyboard attached just to get good sound
in games! How many games output their music to the MIDI ports anyway?

Bill

2593. Magic Online not available

You seem to have missed the point of what I wrote. I said that several
of these problems were pointed out by the beta-testers and have been
corrected. I suspect the demo may be from an earlier version, not the
current release, and that most of these problems no longer exist.

I wonder if Ulli could tell us which version the demo is based on ?

Cheers

Paul

I was going to buy one, as I saw one in advertised in a local paper at
150 GBP. I thought it was quite a good price but then I read on and
it said it had a duff screen, and a hires monitor was included in the
price.
So I left it.
I did a bit of research and found out that it wasn't as good as I
hoped it to be either. Eating up 12 C size batteries in an hour isn't
my kind of a joke. The ST Book sounds better.
Still I wounldn't say no to a Stacy in good working order!

I can remember one game which was held back for release for at LEAST 1
year because of program problems converting to Amiga; and bugger me! the
title has just slipped out of my mind, I can see the game but not the
title:(I hate it when that happens it'll bug me all day now!

Ocean said they won't release a program on one format without it being
complete on the other.

I tried the game on Amiga and the ST and I found the Amiga's version
very much lacking. It starts with a space type shoot em up, in the star
wars style: where you have to clear a path to the exit that level.

It is also well know that program written on a specific machine will be
better than any other when ported over. Yes even the Amstrad CPC had a
game written on and was the best version, some sort of platform karate
game!

Oh! yes! the program I used on the A1200 was Wordsworth (1200 version)!
I had to buy it separately as the machines were sold on there own at
that time!

It was meant to be the best, cost me around ï¿½200! and I tested it
against Calamus 1.09 for DTP and Write On for the ascii print out.

I also came across problems with printer driver and compatibility
software; running out of space on floppy to stick the driver and other
bits on.

But the Amiga issue will always go on. As I said Amiga's strength is on
the game side. Anyone that's played Monkey island will appreciate the
music etc..

But on the serious side of things the Atari wins arms up, inside out and
back down again. The Atari ST boots up in less time, a rock steady
operating system, and wasn't rejected by Atari.

I've had 19 years of computer experience behind me, I favour Atari ST's because they are the best allround computer produced. They are inexpensive (power without the price), easy to use and bomb proof. My first computer was a ZX81 back in 1981, and I've had all the common computers (speccy'2, CBM's...) and many of the rare and not so common ones (memotech, TRS80 model III...).

I don't have to worry if I spend several hours on a document, programming or DTP without the worry of the computer crashing or hanging up. I don't have to buy an upgrade to add midi ports and I don't have to worry about which software runs with which add on!

And there's one thing I can say about MOST Atarian's, and that they prefer to buy original software rather than pirated copies! I bought 140 Amiga titles and 160 ST ones; the Atari one I had No problems with, the Amiga on the other hand was a different story!

50% of Amiga owners who enquired asked a simple question, 'are they copies?' when told NO! they responded 'I'm not interested then.'! They would rather pay ï¿½3.50 PER DISK for a pirated game than ï¿½2 for the real thing (and some had up to 6 disks)!

In the end I gave the Amiga software to my nephew, and he couldn't get rid of them either (because of the same problem)....

Need I say more!

I've got 2 Amiga's here at the moment that I've decided to get rid of:

1 x A500 and 1 X a500+, a memory upgrade and a pile of games: I threw 3 large boxes of software out because they didn't work, so I only have 25% of the software I had for them (so 75% went bad, compared with an average of %15 on the Atari's. This is down to the disk format the Amiga's use and the quality of the disk!)

I'm looking for ï¿½45 plus postage or ï¿½40 collected (GBP's, in the UK).

Hi

SCSI devices! don't you just love them.

Try changing the position in the SCSI chain! Or try the drive on it's
own, then add a device one at a time or even with different cables.

I've had SCSI drives that only work at the end of the chain, and
sometimes the quality of the cables can let it down. I've learnt not to
take SCSI drives for granted, what works on one person's system may not
work the same way as you own and it's VERY frustrating!!!

I can't understand why no-one else agrees with us here Steve, I had a poke about in the RSC yesterday, I cannot believe how messy some of the other boxes are! Text lines that get severely chopped at the ends of lines because they're too long for the forms they're supposed to fit - and so on!

Thats one of my favourite games ever. I thought the music sounded
pretty neat on my ST, but I suppose the Amiga version used the Paula
(DMA) chip. I don't mind those blippy kind of noises in games.
Reminds me of my commodore....

I have to say the Amiga kicks ass at games compared to the ST. In
1996 I wanted to buy some games for my ST. Most of the shops sold
just PC and console titles, quite a few still sold a selection of
Amiga games, but I had to go 30 miles to a shop in Bristol that sold
about 15 ST games.

Games developers like Ocean, Core, Microprose were still developing
titles for the Amiga after they had finished with the ST, like Monkey
Island 2. I believe they started the conversion from the Amiga to the
ST, but finnished about 20% of the way through.

I am still looking for a cheap Amiga with Monkey Island 2......
(with all 12 or so disks that Monkey Island 2 needs!)

Hi Dave,

DW>Wanted - Wiring diagram for conecting a 21" multiscan to my TT so that
DW>I can display TT High Res.
I think that's impossible, for the TT can display TT high (1280*960)
only in b/w, and that there doesn't exist any graphics card that may
display that high resolution via VGA because it needs to much video
RAM.

For your sake I do hope I'm wrong!

I need so info lads!

I've seen an 800XL for sale locally for 20 GBP. Has disk drive, 16
boxed games and 290 something not boxed. Is it worth the cash and
what specs is a standard 800XL. Is it an 6802 jobby?

The 2600 and 7800 were the consoles right? And the 800XL was the home
computer type, or am I wrong?

Thanks for any input on the subject.

If HD-Driver recognise it, HDDR-Util can partition it (try a sector-scan too) and the desktop finds the partition, I don't think there's anything wrong with the physical connection. It's more likely to be a problem with the partition itself, e.g. too big for the OS he's using, wrong partition ID or something like that.

> not believe I have ever had a device on postion "0". Also, change the

There is nothing wrong with ID0, I have that on both my Falcon and TT.

Source record: 57603

Hi Steve,

> I assume youve checked that its ID is selected within HD-Driver CFG options, select
> them all, wont do any harm.

I had checked _ALL_ ACSI and SCSI IDs and LUNs and rebooted when the
problem started :-(
I still don't understand why it would autoboot HDDriver from the hard
drive but then fail to recognize any partitions.

After trying to open up the Stacy and failing (I was going to install a
different hard drive), I was just about to give up when
I was _finally_ able to successfully boot from a floppy with ICDBOOT.PRG
so Stacy is back to her old self again.

Transferred the Stacy's files via floppy rather than MO and backed up to
CDR.

Thanks for responding,
des

Your best bet is to ask this on comp.sys.atari-8bit, since this is part of the 8-bit family of atari computers. Is is powered by a 1.79 MHz 6502, as were all in the atari 8-bit line. It is the second generation of 8-bit, released in 1983. The main "improvements" introduced in the XL family are a streamlined, single-board design, 64K RAM, a smaller sleeker case, and an edgecard connector for external access to the CPU's busses.

As for what it's worth, probably depends on if you have the original boxes or not. A boxed computer and/or floppy drive is probably worth several times what an unboxed one would go for. As for actual dollar amounts, I don't know. The only comparison I can offer is a "new in-box" 130XE (130XE being the third-generation 8-bit released in 1985) that I sold a year ago on ebay for $125 USD. I have a NIB 800XL I might auction, only time will tell if it is worth as much!

Source record: 57607

Hi,

I recently got an old Atari 520ST and a floppy disk drive and I finally
managed to get it to run. But:

1. Is it normal that the computer needs about 1-2 minutes to boot up when
there's a floppy connected? Without floppy it boot within seconds...
2. How do I put floppy image files on disk from my PC? I have absolutely no
software on an ST disk so I can't make a direct serial connection...

Thanks,
--Michael

ATTENTION RETROGAMERS, COMPUTER COLLECTORS, VIDEO GAME FANATICS!!!!

WE'RE BACK!!..

CCAG 2001
(Classic Computer and Gaming 2001)

If you like collecting old computers, video games, and enjoy using them
still, then come join us on:

June 23rd, 2001
9AM till 6PM

National Guard Armory
IT'S ON ROUTE 57!!!

(actual address)
3520 Grove Avenue
Lorain, Ohio 44055-2048
(On Route 57, going North of I-90/Route 2)

IT'S FREE!

Both vendors and attendees!
Computer User Groups and vendors inside, flea market outside!

Setup: 22nd, June, 2001
6PM-10PM

Please Call Ahead for Reservations:

Jim W. Krych jwkrych@n2net.net
440-979-9295
Fred M. Horvat fmh@netzero.net
440-286-2566
And these other CCAG 2001 organizers:

Please visit this site:
http://tomheroes.com/ccag.htm

As of 9/6/2000
User Groups:
TI Chips
Cleveland Classic Atari Group

Vendors:
Video Game Connection
Ramcharged Computers

People/Organizations:
Tom Zjaba
Tim Snider
Curt Vendel(Atari Historical Society)

We are looking to do a "Classic Game Experience" this year!
One room is going to be set up for playing classic computer and video game cartoons and commercials. The other room is going to be an emulator room- MAME, etc. We are hoping for some people with arcade systems to bring them- will probably need a small generator for that.

See ya at the CCAG!

If you have the PaCifiST emulator, it comes with a program called
MAKEDISK that can both make .ST disk images from actual ST disks, as
well as write out .ST images to floppy disks for use on a real ST.

2634. Falcon for sale

Newsgroup: comp.sys.atari.st
Date: 2000-09-10 03:57:41 UTC
From: Gene Pineda <gene@pinedaprinting.com>
Message-ID: <nADu5.290$JC2.96760@news01.micron.net>
Source record: 57615

Im sorry I didn't do this to start.

I live in California but am willing to ship to UK if buyer will pay.

Im going to take bids for a week and at the end best bid will win.
information as to you owning one (working or not) and if you have never been
able to buy one will also wiegh in my decision. I want someone who is
unlucky in bidding like I was for about 2 years to get a TT or a falcon to
get one. BUT IF SOMEONE OFFERS 1,000,000.00 then money talks and desprate
atari users walk! Sorry, but the reality is no one will offer a outrageous
amount so your case will wiegh in the matter.

Heres a rundown and history for my Falcon and CII.

The falcon is working, as best to my knowledge, I run pagesrtream and
Calamus both from it (did not check to print but was told it does)

the CenturboII MIGHT be working. It was installed and the falcon ran but
most programs didn't run in any mode 50mhz or 16mhz.
The 32 megs of ram was ok. I sent the CII to France and Rodolphe checked
the board and said it functions perfectly and that it was most likely
a installation problem. The installer also claimed it might be. We pulled
the board and reinstalled the Mother board.

The CII came in a small anti static bag with paper work on installing. it
also came with a disk with images and installation procedures.

THERE IS NO GAURANTEE ON ANY OF THESE ITEMS. AS IS.

My hones opnion is of the CII it's a bit risky if your not a tech. I have
my doubts about it being a working board. I can't say if Centek is accurate
or not
so their word is their word. AS a benefit to the person taking a risk though
on this piece they will recieve a free 32 meg ram board for it which does
work!
so if the board is bad and someone fixes it they will have a 46 meg falcon
running at 50 mhz. IF IT WORKS OR GETS FIXED!
sorry about the bad news on that end

The Lacie 4 gig ext scsi drive is in perfect condition. I just got this
thing about 8 months ago. NOW I OWN A PC AND AM VERY VERY HAPPY SORRY
MAC!

The warranty that still exists with the Lacie will be up in about December I
believe. It might be dead alread. I will post another message on that.

But it works and works well.

here are the asking prices for the Pieces.

The asking price for the:

Falcon (200 meg hd, 14 megs ram) -- $200.00

CII (possibly working -- didnt work when installed and 32 megs ram, ST RAM BOARD, wizztronics w/ 14 megs ram) $150.00 -- this stuff will cost you a mint if you buy it like me -- about 600.00 dollars altogether after purchasing all parts - 14 meg st ram at 60 nano, st wizztronics ram board, and CII and 32 megs ram.

Lacie HD ext scsi - 100.00 in original box.

Good luck to all

and Please don't LIE about how desperate you are to own a falcon. I want someone to own one who hasnt had the pleasure.
IF your current machine if dust let me know!

thanks a MILLION ATARI FREINDS, I WOULDNT HAVE ALL THE KNOWLEDGE I HAVE NOW IF IT WASN'T FOR MY STE!!!!!!!

THE YEARS HAVE BEEN AWSOME AND ILL KEEP TRUCKING WITH MY STE. AGAIN IT'S BEEN WONDERFUL BUT I MUST MOVE ON

GOD BLESS YOU ALL!!!!!!!!!!!!!!!

Gene

gene@pinedaprinting.com

p.s perhaps we should post the offers so everyone can see if they want to outbid anyone else. also include your atari history if you can.
only post your bid if its higher or if you are desperate to get one. you only need to post your story once

IF there are too many posts and it disrupts the message board then just email me

YOU KNOW WHAT email me!!!! I dont want to piss anyone off for putting up 50 posts!

Take care all,

and

LONG LIVE THE FUJI --- power w/o the price!!!!!

>
> Blitter TOS is 1.04 (a.k.a. Rainbow TOS)

Incorrect.

"Blitter TOS" is TOS 1.02

It got the name "Blitter TOS" as it was the first to support a blitter.

It also featured the XBIOS Blitmode() call to configure the blitter.

It was also fitted as standard to the Mega ST (released in 1987) which
had a blitter as a standard fitting.

"Rainbow TOS" was TOS 1.04 and came later (1988 for the disc-loadable
Developer version, mid/late 1989 for the ROM version)

hello,

it's very strange cause with a ct2, you absolutely have no need for a
blow up hard or a screenblaster. The ct2 provides an acceleration of
the video chip (videl) witch allows such a resolution (800x600) withe
the appropriate program (centscreen + videomod) ; i have a ct2 too
and i do like that

cordialement,

This is absolute correct. Any problem caused by the SCSI hardware would
result in HDDRIVER not properly identifying the drive. You would not be
able to partition the drive at all in such a case.

Windows, Linux, MacOS.

> hard to say Uwe, hopefully Axro, GmBH Milan, etc have done their market
> research
> ad their is a market _OutSide ;-)_ of atari enthusiasts for the
> Milan2...

I bet they haven't done any resarch at all. Anyway, fact (and no rumor)
is that they haven't tried to license important software yet. So even if
they started with licensing right now and even if they got all the
licenses they need (which is not sure at all) they can't make it in time
for any machine to appear in a shop in time for Christmas.
Didn't Ali Goukassian say the first machines would be available at the
end of August since this is the time people start thinking about buying
Christmas gifts? We have September now ...

Now I'm confused (easy to do on Sunday morning). I thought Rainbow TOS
was 1.6, the STE TOS, because it had a coloured Atari logo on the info
box.

Richard, who remembers his /single sided/ 520STFM had the blitter menu
item.

AFAICR, here is a brief history of TOS versions and their names:

TOS 1.0 was known as either "Disc TOS" or "ROM TOS" depending on whether it was loaded from disc when the machine started, or it was installed on ROMs

TOS 1.2 was "Blitter TOS" and first appeared in the Mega ST, and later made its way into the STM, STF, STFM machines.

TOS 1.4 was "Rainbow TOS" - first available on disc to developers, and later as ROMs for upgrading older machines. It massively sped up disc accesses and had a faster user interface.

From the release of the STE and TT in 1990, TOS stopped getting nicknames, and instead became known for the machine they were designed for.

TOS 1.6 and the patched 1.62 were "STE TOS"

TOS 2.x was "Mega STE" TOS

TOS 3.x was "TT TOS"

TOS 4.x was "Falcon" TOS

However, it can be argued that Rainbow TOS 1.04 was STE TOS, as both shared the same general code base, with Rainbow TOS having the STE-specific TOS 1.06 features removed.

Hello,

I think the old Conner drives they put in the Stacy weren't auto parking?
The one in my Stacy 4 died badly. I picked up a second hand 540MB Quantum
Lightning and fitted that instead. It's so much faster now. I use ICD Pro.
On checking the seek rate, the newer drive is 16ms as apposed to 40ms from
the old 40MB Conner.

Indeed it is. Monkey Island 1 took me about 3 months! I got stuck
with the bit where you have to drug those little poddles! I've only
seen a screenshot of Monkey Island 2 and have played the demo of MI 3
on a friends PC.

Did you ever have this problem when going from disk 2 to 4. (I think I
got the right disk numbers). My version would crash out "Error 41" or
something. I found out the way to stop it was to go from disk 2 to 1
THEN to 4. (at the insert disk 4 prompt)

Broken Sword 1 and 2 get quite close to being as good as Monkey
Island.

Message-ID: <8pg88v$af7$2@newsg3.svr.pol.co.uk>
Source record: 57631

Apologies to those who e-mailed 6 months or so before. At the time I had a local "buyer" who seemed very keen to relieve these items from my wardrobe floor, unfortunately he seems not so keen to collect it!

I am therefore offering it again, TOTALLY FREE, to anyone willing to collect it or make other arrangements for its retrieval(?).

In brief, it consists of the following:

Atari ST software
=================
View II, Blitz Turbo lead, Easy Text Plus, Mini Office Professional - Comms, Degas Elite, Family Curriculum Creative Module, Terminator 2, Falcon - Classic collection (inc Missions 1&2), Powermonger - Platinum (inc WWI edition), Triad Vol 1 & 2, Hewson Premier Collection, R-Type, Slap Fight, Outrun, Speed boat Assassins + Mega Lo Mania (works on Falcon).

Bits
====
Zipstick joystick, Cheetah Mach I joystick, Atari Mouse, around 300 DSDD used disks.

Magazines
=========
Atari World Iss 2 - 11 ST Applications 62-73
Atari ST Review Iss 30,31,33,34 & 35
ST Format Iss 68-79 and 82-86 (the last).

I also have the following bits for sale/swap:

ASP Scsi burster cable (never used) cost £18 - offers
Epson SMD-300 3.5" HD Floppy drive ex. Falcon (grey front) £5
Atari Falcon Keyboard with TT-Touch adaptors fitted in Freekeys unit with Mega ST connector - needs connector soldering properly, otherwise cheap spare keyboard! - offers
Atari Falcon 4Mb RAM Card, Nemesis Buffer chip (with free hot glue!).

I will accept either money or unused HD Sony, or similar, floppy disks in exchange for any or all of the above items.

I need to remove this stuff soon! Therefore anything still around at the end of September will be disposed off appropriately.

Thanks for reading this!

Neil Chester.

>had a blitter as a standard fitting.
>
>"Rainbow TOS" was TOS 1.04 and came later (1988 for the disc-loadable
>Developer version, mid/late 1989 for the ROM version)

Okay, now I'm confused. I started my ST life with a 1 meg 520STFM,
which had TOS 1.02. (Basically it was a 1040STFM in a 520STFM case)
I don't remember any Blitter option anywhere, and (obviously) my ST
didn't have a Blitter chip. I later moved on to the Mega ST4, which
of course did have Blitter, and TOS 1.04 and, as expected, this did
have the option to toggle Blitter. Did the first Mega STs have TOS
1.02 before being one-upped to 1.04?

Hi folks!

I was just wondering if there is an update to WDIAlOG.PRG v.2.04 around as I'd like to replace the one that's currently running in my AUTO folder as my part of my hard drive boot-up routine. Any ideas? Please post here.

Cheers :)
Al

The TT High output is ECL (emitter-coupled logic). My TT manual is
not here so I can't give you the TT pin out. I presume you have that
for your monitor. System Solutions supplied me with a cable when I
bought the monitor from them - perhaps you could contact them.

The first Megas were shipped without the blitter installed. When the chip was not there the blitter option was not shown on the desk menu I remember having to take the machine back to the dealer to get the blitter inserted.

Ya' got my curiosity now too! My MegaST4 'DESK' drop-down shows only
"TOS" but no version (Copyright 1986, 1987). The 'OPTIONS' drop-down
menu does have 'Blitter' to check! It's in ROM since I let the machine
load without a floppy disk inserted (no hard drive either).
So is it 1.02 ?
John G.

Richard,

Did you fit that 540MB drive yourself? What's the trick in getting the
Stacy case opened up? I removed all the screws on the bottom and two on
the back, but something was holding the case together at the floppy/hard
drive part of the case. I was able to pry it open everywhere else.

> I think the old Conner drives they put in the Stacy weren't auto parking?

This is true. I use "Ship" in HDX.PRG on this Connor 20MB.

Atari UK sold heaps of 520's with 1.04, and this was also one of the more
popular ST's here in Norway at that time.

Put a blank (ie formatted) disk into the drive, most likely that'll fix the
problem. Could be that the disk that you're using has programs in the AUTO
folder or desktop accessories which the computer is loading and executing.

>2. How do I put floppy image files on disk from my PC? I have absolutely no
>software on an ST disk so I can't make a direct serial connection...

I don't have a clue about image files, but in general the PC will read and
write to disks which you've formatted on the Atari.

I think that you're on the right lines here. There's absolutely no problem with
HDDriver partitioning it (I haven't tried a sector scan), but there's obviously
something extra that I've missed - not the OS, which is MagiC 6

According to HDDriver's docs the correct partition ID is automatically applied
AFAICS. In this case the ident is $0b.

Thanks for the reply! :-)

I cannot get on at all with Centscreen. The bottom half of the screen is
full of pixel garbage and I cannot center the screen on the monitor. I
much prefer Videlity, it's not as straightforward to set up, but for me it
works! :-)

I normally don't have a problem, but...

>Try changing the position in the SCSI chain! Or try the drive on it's
>own, then add a device one at a time or even with different cables.

It's none of these. If I partition this 4.5Gb drive into several smaller drives it works fine. Any attempt at anything larger than a Gig or so, I get a drive letter allocated but no access is allowed (I haven't had time to find the actual limits yet). Jo Even seems to have a lead on this.

Since my Falcon is running MagiC6 and I'm using HDDriver (actually 7.71), I'd expect there to be no problem running this drive as one large partition, preferably in a compatible mode with a laptop.

Thanks for the reply! :-)

It's not that simple actually, from a purely physical aspect! (Leaning
Tower of Pisa alert!) :-)

>not believe I have ever had a device on postion "0". Also, change the
>booting order and have the HS first.

There's nothing out of the ordinary about having a drive set to 0, however

changing it to the next available ID (4) makes absolutely no difference
whatsoever! :-(

My internal IDE drive is the boot drive.

Hello,

I have this program running fine on my Hades. The 286 emulation is just amazing. Too bad the authors never made a 386 emulator or greater for the Atari's. But anyway, there is an option to set the printer port and also COM1 and COM2. Here you can use a program on the Atari as one of the ports. I was wondering if anyone knew or had an idea as to what kind of program (file) could be used here so that the DOS programs ran on SoftPC would access the Atari's printer and modem ports?

What exactly do you mean by "flicker" ?
Does the picture looses its sync in one or both ways or just rapidly
varies brightnes intensity level ?

Hi all,

have been kept away from my office PC for 7 weeks, heart attack not hols, but have been keeping in touch with my Milan. I'm now back in front of my 18" PC and the re-acquaintance with Windows is horrifying. It takes an enforced spell with the purity and downright efficiency of TOS/NAES/THING, to bring home the sheer hellishness of the world according to Gates. If as looks increasingly likely the Milan II comes to nought, this will be a tragedy to make Macbeth look tame.

I am going to have to learn 'Word for Windows' after over a decade of WordPerfect, not to mention Protex and Papyrus. Heaven help me!!!!

I am producing CDs for my son completely on my Milan and Falcons, The CD on my C-Lab, using CAF and CD Writer (with CD Backup keeping the HD lean, clean and mean and the CD label and in-fill card on my Milan using DA's LayoutTC. We have advance orders from Bristol acoustic clubs. I wanted to print the full production history on the CD cover, and 'not a PC in sight', but my son didn't want to offend his PC and Mac VST using friends!!! Oh well such is youth!

Hi Tim

I'm in Leeds, West Yorkshire.

That's good but I have at least two other e-mailed offers at present, so
its case of whoever gets here first!!

Current offer for the keyboard is 20UKP. The SCSI burster is 15UKP.
No offers as yet for the excellent MicroVitec monitor though!

Can you please e-mail me with your location/offers??

Thanks

Neil :-)

For sale

Video digitiser system comprising a VIDI-ST and VIDI-RGB
unit from ROMBO. Together these allow real time grabbing
of full colour video frames. Video input, and saturation and brightness
controls plugs into the ST/STe catridge port. Includes PSU.

All software disks and drives included.

Offers around 35GBP.

I keep getting dismissed as i'm refering to the demo version, but ive also witnessed these problems on your full version when you demo it at club.

Most of the silly errors ive sussed by delving in the binary, others are in the rsc, but the layout is bad in general.

You get into the STacy through the screen. Remove the label that says
STacy just below the screen and you will find two screws. Remove them
and the screen comes apart, thus giving you more than enough slack
cabling to open the lower case.

|in the RSC yesterday, I cannot believe how messy some of the other boxes are!
|Text lines that get severely chopped at the ends of lines because they're too
|long for the forms they're supposed to fit - and so on!

I really do not see many problems with the boxes. In the Printer set-up dialogue there is one box containing 'Remove report' which is too short; and in RTF Import and Export there is a bit of untidiness and overlap. None of these affect functionality at all.

I have started to make a note of niggles when I come to them. One in particular, the behaviour of hyphens, is a problem; another, the absence of a shortcut for Import Graphics, is a nuisance; another, the difficulty understanding the function of master pages, is probably just me.

The hyphen problem comes when a hyphenated word occurs at the end of a line. I normally keep hyphenation off but I would expect a line break to occur _at_ the hyphen. It doesn't, and if you add a soft hyphen at the ordinary hyphen, both are displayed. You can get round this by deleting the ordinary hyphen but a) the spell-checker thinks the hyphenated word is all one and flags an error, and b) the soft hyphen disappears if the text is revised and the word moves from the end of the line. Not very bright :-)

In the old Papyrus it was possible to edit the RSC file to move shift-control-P from the Printer dialogue to the Import Picture dialogue but I have not found how to do this in version 8.

I'm not sure what happened to the Number of Copies in the Printer Dialogue. In version 5 if it was set for a certain number, that number used to be remembered (until quitting the program) but it always seems to revert to 1 in version 8.

I have a table in one template which contains a number. (I sent all this stuff to Ulli.) The number looks fine on screen but is printed in completely the wrong font when using the Papyrus drivers (but not when using NVDI).

Source record: 57572

hi John,

JG>My MegaST4 'DESK' drop-down shows only "TOS" but no version (Copyright
JG>1986, 1987).
so I suppose you're running Blitter TOS (1.02), maybe without a
blitter.

As I think Atari did never release more than one TOS in one year, the
TOS may be recognised by the final year in the menu cited by you.

So '1987' leads me to the opinion your TOS is 1.02 (BlitterTOS)

JG>The 'OPTIONS' drop-down menu does have 'Blitter' to check!
So furthermore, I think you really own a bliiter chip!! My first ST in
'88 was delivered with that (German) TOS, but with no blitter chip.
And there are a lot of applications I'd recommend to switch out that
chip, even there are some that don't run at all a blitter being
activated...

JG>So is it 1.02 ?
Yes, I'm pretty sure it is.

Und TTschï¿½

I don't know the limits in MagiC, but it's possible that you must use
FAT32 for partitions bigger than 2Gb (just a guess). FAT can only access
65536 clusters, with 4.5Gb partitions this means clusters bigger than 64Kb
and I'm not sure if MagiC can handle this. It's not particularly efficient
either...

That matches my experience - just to paraphrase, if I partition the drive
into several smaller ones that seems to be fine. One large 4.5Gb (or 4 1Gb

ones), forget it! MagiC6 and HDDriver 7.71 should be capapble of this,
surely? Partition ID as allocated by HDUtility is $0b. Drive "Busy" light
flashes as I doubleclick its icon on the desktop.

>Offline until 9/20/00.

Same here, I used the address on his website, and it has been quite a
while since I mailed him. If people wants to use AtarICQ with iFusion I
suggest you get in touch with the author of iFusion and tell him about
it.

Since the AICQ.OVL for AtarICQ is written by Dan Ackerman, who also
happens to be the main developer of STiK2, my guess would be that it is
fairly STiK-compatible ;)

Yes, somebody knows. The filter capacitors on the video outputs
are too big for the capacitances of some monitor cables. The
solution is to make them smaller. Some soldering in required!

I must be ultra fussy then, but I still cannot understand why all these
niggles weren't sorted at the time the RSC was generated. It doesn't take
any longer, and such oddities as text cut short because it overlaps the
edge of a box would have long ago been sorted! It's also peculiar, because

usually a translation from German is shorter than the original.

>I have started to make a note of niggles when I come to them. One in

It's good that you're reporting these problems back to Ulli, mayhap the
next release will address some of them. I understand that there's an issue

with the lable printing routine too, I haven't come across this yet as I
haven't had the need to print any yet!

In that case, you _must_ use FAT32 as partition type, as FAT16 (the
default) is limited to 2 Gigabyte partitions, i.e. if you create a
larger one and don't tell HDDRUTIL that you want a FAT32 partition, you
won't be able to access it afterwards.

Ciao

Thomas

2698. Re: Some Milan news..

Newsgroup: comp.sys.atari.st
Date: 2000-09-12 12:04:15 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3Zov5.2768$RL4.2875453@nnrp6.proxad.net>
Source record: 57579

My personal experience with Milan crew is bad... :

I asked them if they may need a DSP56301 + audio card to emulate the Falcon.
They (ALI) answered me that was very good idea and they need it.
I designed the DEESSE card (www.czuba-tech.com) and finished to assemblme
the prototype just for the 10-10 june show !!
They saw my card and seemed very enthousiast. We spoke about technical and
financial points.
Ali told me he will conatct me after the show about DEESSE, especially
because I needed a Milan mb to test Deesse and let my coder do the driver !
But this day, I have no milan mb and no driver was developped for deesse and
Milan !!!

I really think now that the developper strategy is near equal to ZERO !
I think that milan is a 'day after day' 'adventure' without any planning !!
If you consider the time since the show of june : if I had a mb, this time
the Deesse card should surely be ready and the driver too !!
This means that they would be a DSP + audio 24-bit card ready to be bought
by the milan buyers !!
But now, if the Milan 2 is here, the D�eese will not me ready the same time
: it is clearly an example of a 'not planned business and design'...
A other sign is that a good list of software and hardware projects with
authors and companies should be available on the net : it is not the case !!

I can proudly say now that even with a small product like CT2, my
developpers and users communication was better; and I had no 'big' (?)
company like AXRO behind me !!! Think about thatn guys !

I really don't understand Milan company now....

Milan 2 with a 060 and some good software like DRAKONIS could be a good
internet terminal (net box) because of the code size (could be put in a
flash without HDD) and the speed of the OS with a 060, so some good markets
are/were possible...

2699. Possible TT030 sale...

Newsgroup: comp.sys.atari.st
Date: 2000-09-12 15:56:26 UTC
From: asdf <asdf@asdf.com>
Message-ID: <GBpv5.546$X92.2050@newsfeed.slurp.net>
Source record: 57580

Hi there,
I have a TT030 with german TOS 3.06 and keyboard. The system
has a Crazy Dots I gfx card with the 15bit extension. It also has 16MB
TT-RAM + 4MB ST-RAM. The HD is 800MB and it also comes with a SyQuest 44MB
removable drive that comes with 9 disks. The system works great with no
problems. Some of you know that I just bought this computer but my school
requires me to use a PC and I'm looking to get a car so I need all the extra
cash I can get. I am going to ask you to make an offer and if the offer is
reasonable I'll sell it. Naturally the highest offer wins. I am located in
Sudbury, Ontario, Canada. Buyer would pay for Shipping. My email is
gaiyan@vianet.ca Thanks.

Joshua.

2700. [HELP] modifying a RSC file ....

Newsgroup: comp.sys.atari.st
Date: 2000-09-12 16:08:02 UTC
From: Jo Vandeweghe <dipching@pi.be>
Message-ID: <39BE54DE.35FE8A20@pi.be>
Source record: 57581

Since a long time ago I'm registered to the german shareware ADDRESS
2.04, this program allow to manage addresses and I virtually use it
every day.
This program is sadly nomore supported by his author and I've tried to
edit the RSC file to make the window where appear the names bigger ....
In this window 12 addresses are shown and, of course, on the right side
it exist the two arrows and the band to make other addresses scrolling
in this window ....
While trying to modify this, I encountered problems:
1 - It seems impossible to make bigger size for the different elements
of the slider and arrows on the right side.
2 - The window where appear the adresses is full of lines like
"01234567890123456789" .... how to add some more lines ?

If anyone can help me to achieve this I would be happy to share the
result of this work I only hope it will be possible to do this ...
Thanks for any help

Jo

Hi There!
I am trying to upgrade a Mega4 from TOS 1.02 (2 Chip) to TOS 1.04 (6 Chip) is there anything I need to change on the logic board as all I get is a blank screen with the 1.04 chips.
The 1.04 chips are known to be good as they were pulled from a working 520ST

Cheers,
Dave

It's easy to modify a RSC in this way (typically (maybe [Shift])
drag&drop the line) but it'll be useless without a rework of the source
code of the program.

Bye,
/Pascal/

Yes. Change jumpers W2 and W3 so that they both link positions 1 and
2; install a jumper in location W4; remove IC U12 (which is a
74LS11).

Make sure that the chips are as follows:

U3 C300641-002
U6 C300642-002
U9 C300643-002
U4 C300644-002
U7 C300645-002

The easiest way I've found of getting to the internals is to remove the rear cover off the screen. Disconnect all the cables then feed them through the lid as you take the top off the Stacy revealing the internal screening. Then balance it safely while you remove the screening after disconnecting the keyboard. It's a pain in the bum but it was worth it for the increased speed from the Quantum drive.

I've performed this ritual a few times now what with having to reseat the RAM board because it forgot it had 4MB. Replace the screen backlight and internal PSU (from Best Electronics). Fit an updated Atari SCSI internal adapter board.

I used ICD HDPARK to park the old Connor drive.

Hi Rodolphe. Why not write drivers using a Milan040? Or even a Hades? If not, add yet another PCI slot to your CT060 for the Deesse and write drivers for it using that ;-) How is the development of the CT060 coming, btw?

Diamond Back should do it. Select 'Split Files' and it will use as
many floppies as is required. I have had some difficulty in
transferring things to a pc using Diamond Back under Gemulator. DB
claimed not to find a volume number and refused to extract anything.
However, I have used it from Atari to Atari in the past without any
problems.

There are various splitter programs available. Some are
Atari-specific, others are UNIX ports so you need to find
the same program for both machines. If you get really
stuck, you could UUEncode them then split them into
suitably-sized chunks with a text editor.

I have a M128 with drivers, but no documentation. I'm not sure if the M128
driver works with the M110, but if you want to try it just mail me and
I'll send you a copy.

From: jba4@po.cwru.edu
Message-ID: <39bfd269.2550372@news.cwru.edu>
Source record: 57508

Hey everyone! Remember me? I had recently (like two months ago, that is) complained about hard disk problems. Well, the only advice that actually worked was one person's remark that I should definitely format the boot drive before installing a new HD driver. SO now I have my TT030 operating under CBHD v. 5.02. HDDrvier didn't work at all for some reason (it did not detect external devices), but frankly, I don't care.

Anyway, what I was actually getting at was trying to connect the TT to a PC. Now my TT030 has some screwed up serial ports that will only operate at 19200 bps, no higher. And yes, I've installed HSModem and no that did not fix this. Anyway, I'm sick of transfering between my PC and the TT at 19200 bps. Is there any other way to connect them. I am not currently open to an ethernet solution right now.

I noticed that Sting comes with PLIP drivers for the parallel port. But, upon doing some research, it appears that this is not at all compaitble with PLIP solutions in Linux or Windows. Is this correct? Now my Atari does have a parallel port mod (what kind, I don't know) which is the reason my serial ports don't work (or so I've been told). So are there any other solutions to the problem of getting the TT connected quickly to the PC?

I might just have to resort to ethernet...

Yes, I understand this, and I've tried all combinations of TOS/DOS
compatibility modes and entering F32 into the "Change partition type"
dialog box in HDUtility. jinnee _still_ "boings" at me when I try to open
it on the desktop.

I'm stuck now.

Hi Charles,

CS>Is there a way a splitting huge downloaded bin files in order to
CS>transfer them via 1Meg floppies to another computer, please?
if I'm not wrong the ARJ archiver is capable of producing those
floppies. Maybe it's possible in one direction only (creating on a PC,
decompressing on an Atari or any computer whatsoever).

A program I'm sure it can solve your problem is TAR, but I never did
it myself. So I don't know the precise command line necessary for that
purpose.

If you choose to go the TAR way, let me know.

Hi Charles

Know the feeling, did this one time for my brother:)
There is a old program called Splitter that was on one of ST Format's
coverdisks. I used that to split the files up and then we just dropped
them on Stuffit and it put them together again. Don't have the
coverdisk's availlable right now but I can have a look around tomorrow.

I have never been able to boot directly with HD-Driver on my STacys, regardless of harddrive. I have tried it on a 20Mb Conner, a 52Mb Quantum, a 105Mb Quantum and a 170Mb Seagate. I have to boot with AHDI, if I want to run HD-Driver (e.g. to use DMA under MagiC, or FAT32) I must run it from the autofolder.

Also, HDDRUtil isn't able to neither format nor partition the internal drive. This is the case on the MSTE too (it has the same SCSI-adapter as the Stacy), I was trying to partition a LPS105 on a friend's MSTE a couple of years ago and had to connect the drive to my Falcon instead.

> I tried booting from floppy with HDD, ICD and AHDI. But the Connor is not
> seen by any one of these.

This is strange. Both AHDI and ICD works fine on my Stacy. Also, HD-Driver works OK too if booted from a floppy or the harddrive's auto folder.

> Any advice is welcome.

Are you sure that your drives has different ID's? It's a stupid question, I know, but on the Stacy and MSTE this can be a bit confusing. With this lame SCSI-adapter the hadrdrive's ID must always be set to 0, while the SCSI-card's ID can be set to anything. So checking the drive's ID doesn't help, you must check the card's ID.

Garone) drooled an embarassing wet spot in his lap as he typed:

>Ya' got my curiosity now too! My MegaST4 'DESK' drop-down shows only
>"TOS" but no version (Copyright 1986, 1987). The 'OPTIONS' drop-down
>menu does have 'Blitter' to check! It's in ROM since I let the machine
>load without a floppy disk inserted (no hard drive either).
>So is it 1.02 ?
> John G.
>

If the fuji symbol has scrolling rainbow colours, then it's 1.04
(hence its nickname, "Rainbow TOS). If it's the standard black, it's
1.02.

TOS 1.06 was basically TOS 1.04 but, had the upgrades for the STE this version
also has the Rainbow Fuji logo.

Don

Or everyone can check out the TOS information at the web site I found which
seems to contain the information about TOS from Atari Corp

http://www.atari-st.lovely.net/atari-st-docs/os/Tosguide.txt

Hi Gerhard

HTML2TXT was reviewed in AC recently. Programmed by Thomas Sahlin.
HTML2TXT homepage - http://user.tninet.se/~jyc891w/software/html2txt/
I'm not sure if the URL is correct, so if it isn't then I can send it
to you.

Works very well, never had any problems.

Message-ID: <ROTv5.9112$FI2.74876@nntpserver.swip.net>
Source record: 57531

Hi,
It would help to supply TERMPWR to the correct pin in the Zip-drive. I don't remember which pin it is, but I'm sure someone else does...
TERMPWR is used as the Link's powersupply, so without it, it'll never work - and even though the Zip-drive has the termination active, it doesn't supply the TERMPWR, like all (?) other SCSI-units do :(You can get a 5V power supply from a joystick port and connect to the TERMPWR-pin in the second SCSI-connector.
Another way to make it work, is to connect an external harddisk, CD-rom or other SCSI-device after the Zip and have the terminator on that unit instead of the Zip. Then the second unit's TERMPWR will provide the power to the Link-interface...
Software? Any harddisk driver, but I'd recommend Uwe Seimet's HDDriver.

Best regards,
Claes

>tape or hotglue is the key here.

Hi Jo,

I used to have my 1.7gb 3.5" HD in between my floppy and PSU with a
TUS IDEal interface. Had to remove all shielding and install half
height simms from an old 386.

Didn't you have problems with heat build up? Because I certainly did.
The power connector was home made as a normal drive connector hit
the PSU caps.

I ended up moving it all to an ATX full tower as one of the large
smoothing caps blew a hole in my PSU!

The IDEal interface needs a leg on the MFP to be cut and two wires
soldered to either end and a wire to the shifter for 16mhz. How does
Mario get around this. Is my interface running twice as fast as
Marios?

And does anyone reckon if my CPU was at 16Mhz, I could clock
the interface to 32Mhz. The chip is a PLD MACH with xxxxx-15. I'm
assuming the 15 is 15ns speed grade. That would mean 66Mhz top.

Euch, the German equivalent of this newsgroup post daily more messages
then c.s.a.st and c.s.a.st.tech together.

>for me since it would not be good if everybody would be using
>newsgroups in their native language. I think the French do that but
>at least the Germans (and Austrians like me :)) are so used to
>English that they rather join the 'international' newsgroups.

They surely don't join the international newsgroups. Most of the German
and French just stick to their newsgroups.

The most important German groups are:

maus.computer.atari.dtp (mostly about Calamus, all versions)
maus.computer.atari.internet (Internet related postings)
maus.computer.atari.mint_mtos (MiNT related postings)
maus.computer.atari.hardware (hardware related postings)
maus.computer.atari.software (software realted postings)

The language used is ofcourse German.

Check if your hoast adaptor supports TermPwr.
ZIP devices doasnï¿½t generate TermPwr. Must come from the Host or any
other SCSI Device. If not, ZIP doasnï¿½t terminate SCSI Bus well.

That doesn't seem to be a problem, I've been doing this for a couple of
years now:)

The only casualty was that I somehow lost 900 meg of compressed (MSA)
data, about 1 years worth of cataloguing:(

How can you have a 'dongle that bypasses' the protection!!!!

The dongle IS the protection, the program checks and reads the dongle./
If you have a bonified (legal) copy of Notator then you should have the
dongle!

From: Richard Ballinger <rich.eb@btinternet.com>
Message-ID: <8pr6rqcie1@plutonium.btinternet.com>
Source record: 57453

Hello,

I use a Zip 250 drive which is connected to my STE via an external HDD. The HDD is connected to my STE via an ICD link 2 adaptor, (you don't say which adaptor your using). I know that the link 2 requires a 5V supply which is obtained from the SCSI bus. I know the Zip 250 drive doesn't supply this, I assume the Zip 100 is the same.

As far as software. You don't need any extra. The ICD software recognises it as an extra drive on the SCSI bus and knows it's removable media.

The only problem I've had with mine was data error caused by poor quality/too long cable. I used a SCSI adaptor with the original Iomega cable in the end. Haven't had any problems since.

I agree. Nothing is needed in the Config file on the C partition of the
emulator. What is needed is a program on the Atari or else a device name. I
have typed in "Modem 2", but have gotten no results. I am thinking I need
some other kind of name for the Modem 2 port.

No, Bob: the Mac can read Atari floppies, as long as there was no
resource fork included in the download which, of course, the TT would
ignore - if I have understood what a Mac expert told me.

Thanks, anyway,
Charles.

>would have to make a copy back to disk.

Well, I suppose I could just buy some blank floppies and do it that
way. A little convoluted, but if it'll save some of these disks from
utter destruction, it'd be worthwhile.

>If you want a copy i can email you one. Just send me mail asking for

Body handling: HTML body converted to readable text

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/
Web info in my Signature attached to the bottom of any of my messages!

am swamped and I find it hard to keep up with reading the NewsGroups.

Wanted: Mega ST4. Willing to pay up to $100 U.S. Read on if interested!

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

Try Petr Stehlik's PARCP utility, connect two machines together via the
printer port. Available on the web, use a search engine for the URL.

This might also be useful info for Charles Stanley's file transfer problem.

You could try Lynx, which has an option to output plain
ASCII (I can't remember what the option is off hand).

I think Lynx is only available for MiNT, but it might work
under TOS for local documents, which just means that you
would have to retrieve the document with another WWW
browser before displaying it in Lynx.

Im hoping to place a 2.5" between the simms and the back of the case or floppy. Planning to drill some holes in the Shielding to mount it. Think that would be a problem?

>

Thankfully I have the STE was going to try it on a STFM too. Ill see how the STE goes first then I do some soldering.

Thanks, Don

From: Kevin Savetz <savetz@northcoast.com>
Message-ID: <savetz-5198CB.00140914092000@news.northcoast.com>
Source record: 57540

Greetings.

I'm looking for an ST file transfer pro who can offer some
assistance to the Digital Antic Project. We are starting to put
the full text of STart magaizne online -- as part of this project,
we need to get the software online too. I need to find someone
who can create .MSA archives from floppies, test the archives
that have already been created, and help index the files
published on 44 STart magazine disks.

If you want to volunteer, all you need is some spare time
and the ability move files between an ST and the Internet.

Thanks,
Kevin Savetz

No. But it may be that the partition wasn't properly initialized as
FAT32 by HDDRUTIL, so that MagiC refuses to accept it.

I don't know whether it works without MiNT, but you could give Frank
Naumann's mkfatfs a try:

http://wh58-508.st.uni-magdeburg.de/sparemint/mint/tools/mkfatfs/

Ciao

David Williams <Dave@darkstar64.freeserve.co.uk> wrote:
>Anybody got any info on a MatScreen/M110 ?
>I am after pinouts, drivers and details of screen resolutions

I had one in my 1040ST machine for quite some time - I think I still have it somewhere.

The card did 1280*960pixels on an ECL monitor (Moniterm M110, later Eizo 6500 in my case). However, the original driver did not work with CPUs >68000, so I finally ended up writing my own. The Hitachi graphics processor is actually quite flexible in what video modes it can generate - it can even do a limited number of overlay windows in hardware.

The card only works if the -5V for the ECL output is supplied by the monitor, otherwise, it is completely disabled (even video RAM!). And due to the size of the card, it loads the CPU bus quite a bit - in the original Mega ST in which I got the card, the system became instable when both the M110 and the (old+huge) 4MB memory expansion were installed. In my 1040ST with selfmade MegaBus extension, I had to put additional pullup resistors on the data and address lines on the CPU bus, IIRC around 2k2, to get the system working stable.

There was a colour option, however, IIRC it could only handle 640*480*16 colours.

Hi,

1. I'm using 2.5 hdd and atapi cd rom drive and it works GREAT!
2. It fits inside the STe very nice...
3. Instalation is very easy, you may put plastic glue onto cpu in
order to make it very stable...

alltogether, worth investing!

cheers

Hei all.
Just curious on whether there is a German equivalent version of this
type of site.

regards

> recognize these ports

It is done at a bios level on the PC, but I think soft PC has a little check box or two to actually enable them. I have used SoftPC the only thing I couldnt get to work was the Atari mouse.

g'day bob, I found that Aniplayer had real problem's with MP3 on my Falcon, skip's and carries on. I must be doing something wrong or either you have a Faster Falcon or possibly a 44.1 clock?

Mark Bedingfield

PS I find the easiest way to transfer files is to burn an iso9660 cdrom on my PC:-)

Nothing except the usual stuff - TOS can't boot from most WD-drives. This
is a TOS-problem, not a hardware-problem.

> 2 Where did you mount the hard drive 2.5"?

I shoehorned a 3.5" between the PSU and floppy in a STE. Double-adhesive
tape or hotglue is the key here.

> 3 Any problems with the installation?

Do you have a ST or STE? On the ST you must solder a socket on top of the
CPU, that might be a problem for some. The STE-version is plug & play.

If you mean a newsgroup there are some existing but I haven't found
any that's alive (= more than 3 messages a month) which is okay
for me since it would not be good if everybody would be using
newsgroups in their native language. I think the French do that but
at least the Germans (and Austrians like me :)) are so used to
English that they rather join the 'international' newsgroups.

Source record: 57397

Hi there, I've had the a similar problem with Aplicat over here
in Canada with my TT. Some how Magx desktop never got installed
properly, so I use Thing V.127. Magic 6 works OK. It may have something to
dowith the disks or the disk drive in my (and yours) TT? I've heard
that the disk drives on TTs can be flaky. I think the magic desktop
installed OK on my Falcon. So if you have an external disk drive
it might work.

Michael and Nicole Freeman (nameerf@flash.net) wrote:
: Hello again!

: There's a couple things still keeping me from fully using
: Magic that maybe someone could help me with. The main thing is,
: whenever I click on a program icon, then select "Install
: Application...", the dialog box appears just as the manual said,
: however, after I'm done with that dialog and click on [Install], the
: dialog disappears and nothing else happens. According to the list of
: running applications, the "APPLICAT" program is still running, but
: there is nothing happening. The *thin* 39-page manual doesn't say
: anything about what's happening, and gives me no clues as to what to
: do next. So I can't install any applications. Any ideas? Is there a
: bug in APPLICAT that I should be aware of? My system is a Falcon, and
: it's Magic version 6.01. Thanks!

During a rescent trip to a show, I happened apon some brand
new Atari T-shirts. I picked one up but guessed wrong on
size. Rather than run it back, if someone here wants
it they can have it for exactly what I paid for it.

It's dark blue, with a large Atari Fuji logo on the front.
It's XL size. Cost me $18 bucks. I will send the reciept
along to prove it. ;-)

Shipping inside the US is free. Outside the US will cost you.

That is what I think also, but the problem is how get SoftPC to do this. I have ProComm and SoftPC loads it fine. I get all the screens, but I cannot dial. If you would like to give SoftPC a try download it from this address:

http://www.holleman.demon.nl/

It will run on any Atari computer that has a 68030 CPU or higher. It does not like Magic, but it does like Geneva (may also like N.AES). Give it a try and see what you come up with. I would like to access the modem port as I bought JUGS and am hoping to do it all on an Atari computer.

Hello Michael!

MANF>According to the list of running applications, the "APPLICAT"
MANF>program is still running, but there is nothing happening.
The name of the program that 'installs' MagiC on your hard disk is not called APPLICAT, but INSTALL.APP or INSTMAGC.APP (at least for the German version).

That soft needs your name and personal ID and provides you with a ready-to-run version (a reset is neccessary of course) on your hard drive...

Und TTschï¿½
ps

Are you realy sure?
I thought FAT32 support came with the version 6.1 of MagiC...
I am wrong or not?
So I verified: In the German Atari Mag "ST-Computer" 4/1999 is written
that MagiC Atari 6.1 supports now FAT32 Partitions.

Sorry, but I don't think you'll get it to work with MagiC 6.0.

Regards
Philipp

Sorry guys, I've missed the original(s) to this thread. Is it about foul disgusting language like 'girlfriend', 'wife', 'commitment', 'shared bank -account', and other hideous stuff like that? <shudder!> ;^)

...ooops, I'd better send this quick, else I get into deep trouble!! 8^)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hehe! Nothing beats a good ol' bit of 'friendly persuasion' when installing
stuff into an ST! I've managed a 3.5" into my Falcon, as well as prepping
my STe. I just need to afford Marios little device now.

Also, the 3.5" in the Falcon is a godsend because I had to remove the infernal
(er, internal!) speaker!! 2.6MB/sec is usual with the 1.2GB Quantum Fireball
I'm using in my bird, which is better than any 2.5" drive I've seen...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

>No. But it may be that the partition wasn't properly initialized as
>FAT32 by HDDRUTIL, so that MagiC refuses to accept it.

Latest update - I formatted and partitioned the drive into 2 2Gb partitions, which seems to be the largest size that I can use according to the Help pertaining to this function. I can now access both partitions, but not if it's been divided into one partition. A partial success, and much better than I'd been seeing before!

Maybe Windows poisened the drive, so it needed a good formatting to cure it! :-)

>A client of my wife gave her a cartridge from his digital camera that

Interesting! That cartridge could well have been a compact flash device - any
widget that ataches to a PC to allow them to be read should make them appear
as drives, and hence available via PARCP or similar software to an Atari.

It's also possibe to buy a SCSI adaptor for reading/writing those devices,
but they're quite expensive I believe.

I'm a little confused! From what I can make out, you're expecting that
installing an application with Applicat should also make it run?

IIRC all you're doing with install app. is giving the app a special icon for
the desktop, or associating it with files so that double clicking one will
automatically launch the app and load that file.

If you want apps to run without being clicked on then they must be copied
either to the Auto or Start folders depending on their purpose.

Have I got the wrong end of the stick?

Hi, Ed,

I've been reading this thread. I always wanted to try
SoftPC but never got it done.

Anyway...

On PC's of that era, AFAIK the standard PC came with 1
printer port and 2 com ports. I believe you could have up
to 4 of each. Printer/parallel ports were LPT1, LPT2, etc
and modem/serial ports were COM1, COM2, etc. LPT1 is
usually connected to either your printer. COM1 was usually
the mouse. I usually found the modems attached to COM3. I
doubt that calling it modem 1 or 2, serial 1 or 2 would work
unless the SoftPC programmers put it in the emulator code.
And if they did that, it might cause other emulation
problems as the ports can be used for things other than
printers. In this windows machine I have now, I have a
parallel card for the Epson scanner I own, and it's LPT2. I
don't know what would happen in the case of other serial
devices. It may be that if a physical card was required in
the real PC, you may not be able to emulate the other ports
since there is no place to install a physical card for the
device or for physical connection. Although, since the
Hades uses a standard PC motherboard design/layout, the
places are there for the cards.

I would suspect the emulator would successfully access the
printer and modem 1 ports by sending LPT1 output to the
printer port, and COM3 stuff to the modem port. I sure have
forgotten a lot of my old DOS stuff. I'm glad I kept my
books. <G>

That's quite interesting. I would have thought there would have been
little difference between all three. I put my interface down to why
STinG (versions newer than 1.12) don't work. Maybe it's something to
do with the wire cut on the MFP. An STE exactly the same (and I mean
it!) except for the interface of course, works fine.

Hang on I'll just go away to check the MFP chip number.....
right it's pin 27. I might check on the schematics what the hell is
that pin.

IIRC the IDEal interface also includes a MFP accelerator which boosts the
serialport to 38k4.

> alltogether, worth investing!
> cheers
> sasa

1-fuji 1.2 GB 2.5"
2-between the RAM and PSU
3-almost none. the hardest part was cutting and resoldering one
resistor(?)
so that I could use the TOPS 2.06 chips that came with it.

one thing I noticed though on mine and a friends installation.
the IDE board is pressed down onto the CPU in the STe install, and it
has a tendency to work its way back up and unseat it self over time. I
solved that by putting some non conducting
lightweight thick material between the shield and the IDE board/CPU to
hold it in place.
Once the shield is screwed down, it holds the, er, cardboard, applying
light pressure to the IDE board so it doesn't unseat from the CPU.

Now my Ste can be taken anywhere, and plugged into any old TV when it
needs to be used! :-)

2822. Magic 6.01 Install Application problem

Newsgroup: comp.sys.atari.st
Date: 2000-09-15 03:52:49 UTC
From: nameerf@flash.net
Message-ID: <l2hw5.7273$oc3.466299@news.flash.net>
Source record: 57477

Hello again!

There's a couple things still keeping me from fully using
Magic that maybe someone could help me with. The main thing is,
whenever I click on a program icon, then select "Install
Application...", the dialog box appears just as the manual said,
however, after I'm done with that dialog and click on [Install], the
dialog disappears and nothing else happens. According to the list of
running applications, the "APPLICAT" program is still running, but
there is nothing happening. The *thin* 39-page manual doesn't say
anything about what's happening, and gives me no clues as to what to
do next. So I can't install any applications. Any ideas? Is there a
bug in APPLICAT that I should be aware of? My system is a Falcon, and
it's Magic version 6.01. Thanks!

I'd think so. I've never had problems booting either, although I try to
stay away from Seagate if I can - their drives was of exceptionally poor
quality. It might have improved now, but I've never had a Seagate that
didn't die on me...

> Im hoping to place a 2.5" between the simms and the back of the case or

Should work fine. But using foam tape (3M) or hotglue would eliminate
vibrations and reduce noise.

Well if it does it's an undocumented feature! Pin 27 (which is the
cut one) is nothing to do with the serial port. Pin 17 or 10 or one
of those on the other side is how to speed the MFP up.

I've just checked on the schematics and pin 27 goes through a gate
(probably an OR) to the WD1772 INT pin and to FDINT on the ACSI port.
So this could be the problem I'm experiencing with STinG as it's when
I access my Hard Disk.

Hi

I've just uploaded a page to my web site so now you can now download DC Format 3.0: an Atari formatting program which support several; format types (MS-DOS, spectre.. etc). This is program answers the most common of questions: 'How can I use floppy disks between ST and PC?'

More useful programs will be added in time:) or if I get enough suggestions for useful programs.

Steve,

Why waste everyones time asking this over and over to everyone who post a wanted or for sale. READ before you ask the question over and over his Organization line says that he is from Norway. Hell maybe Im wrong but I thought there was only one Norway.

It makes alot more sense to me if your interested in the item for sale or wanted to email the person privately. This way we dont clutter up the newsgroup with senseless posts over and over. Yes, it does help out when people post where their from too.

2840. Need good book on 68K M/L programming

Newsgroup: comp.sys.atari.st
Date: 2000-09-16 00:00:00 UTC
From: ae2598@wayne.edu
Message-ID: <Pine.GSO.3.95.1000916213038.11058B-100000@mail1.wayne.edu>
Source record: 57436

Hello, I figured the best recommendations would be from STers! I'm in a class that covers the motorola 68000 programming and internal architecture. Since the prof didn't even offer us a textbook, I would appreciate any reccomendations of a good book that goes over the 68K in pretty good detail. It need not pertain to the ST specifically, but it does need to go into pretty good detail on the addressing modes, explain what each instruction does, etc.

Now THIS won't make anyone here too happy, but does anyone know of a 68K cross assembler that runs on the PC?

thanks,
kevin spears

I talked to the "genius" behind EdHak because there was some talk on
this site about EdHak and whether it was free or not.

Neron

Subject: EdHak Free?
Date: Wed, 6 Sep 2000 17:43:02 -0400 (EDT)
From: harvey@ic.net (Craig Harvey)

Yep, I guess I might as well call it free, since I've been letting
anyone
who asks for it have it by downloading the latest version (a few yrs old
now), which was 3.21. However, the way I currently have it on the web
requires you to use a prior version to decrypt it using the secret
password:
"2for1" (that's the numeral one at the end, not the letter "l").

You can send people to the now somewhat obsolete web site:
http://ic.net/~harvey/editplus.htm

I guess I should update the info there and make it an easy
(non-encrypted)
download. We'll see if there's enough interest to warrant that amount
of
effort.

Obviously, they should not expect any support/updates/bug-fixes at this
point, since it already achieved perfection. ;-)

APPLICAT saves what you install automatically. You need also to click
SAVE OPTIONS when you have finished installing: this updates MagX.INF
too. Re-Load MagX.Inf and you're set to go, eg, double-click any .HTM
file that you have chosen to be run in CAB and CAB will start up by
itself.

Cheers,
Charles.

Hi Charles,

Glad you got them, what emailer/news app do you use. My main problem is I think my ISP Zetnet, dropping the line while I type in real time as I haven't got the knack of typing off-line and sending later. Lost quite a few large responses that way. Happy splitting.

Bob King.

Hei David.
I have a old TT030 Keyboard, the space bar is a bit loose
and some of the keys need a extra tap.
I have spare Hi Res monitor, which I don't use.
What type of RAM upgrade I have the original 4MB TTRAM spare.

regards
Manchester .UK.

If you use ESS-Code you can make it split up the files automatically during either UUE or MIME coding. Don't know what the largest segment size is, though. ESS is available for both Atari and PC platforms. Might be wise tro switch on the 'Table' option to take care of any character set differences on the two platforms.

>Some time ago I saw a utility to convert HTML to ASCII text.
>Now I would need it and can't find it anymore.
>Anybody there who knows where to find such a utility ?

There is HTMLXPRT by Mark Baines which will let you view HTML files as pure text, and with a suitable viewer (like Look'n See) you can then write it to a file. There is also HTML2TXT, and a module of TUC (The Universal Converter) can also do it.

But perhaps an easier way is to just load the source code into a text editor such as Everest, and after enabling wildcards use find <*> and replace it with nothing. Don't know if this works properly with frames or tables.

> Falcon and Centurbo II installed? If so, which version, and are there
> any special settings?

Yes, here ii¿½m .)

Works clean and fast. No special setting on HDDriver or CT2 Menue.

On some CT2 falcons HDDriver woni¿½t run if an old original 2.5" IDE
hard drive is used. These drives cani¿½t be used well in turbo mode!

Manual doasni¿½t contain this gag..

CT2 details -> DOITF30 (most of in german language)

First cecile detects all devices of my chain. And thati¿½s a lot..
Second MagiC start up
Third, HDDriver come up, detect all devices an let MagiV boot from C:
Thati¿½s all. Evry day since i used CT2

Before i had to change the cheap slow IDE from Atari.

Regards, Robert

Bonjour :)

Alain LARRODE has upgraded his audio CD player.
-> http://www.chez.com/lrd/

The author has worked mostly on bugfixing. And all imperfections
due to the program have been corrected. If you can read the French
history.txt, the bugs due to the CD drivers are listed.
(The HYP doc is not modified, only PRG and RSC).

PlayMyCD is a shareware (100 FF, 15 Euro).

Bye

Pierre

Benny,
There were problems with the DMA controller on some "early" STE machines.
Apparently they worked fine with the Atari SCSI controller but not with some
third part ones. I can't remember the details, I just remeber changing the
DMA chip in my STE. Not a nice job. So check that whatever you buy works on
your STE. You may also look at the IDE controller at
http://gem.win.co.nz/mario/hardware/index.html .

Hi,
Thanks for that, but I am really after on original TT keyboard (Just me being fussy :)
I think I have located one now anyway

I am still after a monitor capable of displaying TT high resolution.
Anybody got one? Or even the pinouts of the TT's monitor port would be usefull as I have a monitor capable of running at 1280x960 that I would like to try on it.
Anybody have a list of 3rd party monitors that do work on the TT?

Cheers,
Dave

> have ProComm and SoftPC loads it fine. I get all the screens, but I cannot
> dial. If you would like to give SoftPC a try download it from this address:

Does the documentation of SoftPC mention configuring the PC at all? I think you get to the config stuff by usually pressing the F2 key during a normal DOS PC boot up procedure. You should be able to see if SoftPC is at least configuring itself to put the modem on a certain COM port. If no COM port shows a modem, then you will have to figure out how to have a modem connected to COM(X) before ProComm or any other PC comm program will dial. Since we are also dealing with the Hades, you'll also have to be sure physical port on the hades is the same as SoftPC thinks it is.

I don't have any of my Atari's currently hooked to a phone line, and at the moment, I don't have the time to try SoftPC. Maybe someday. <G>

To respond to this message, please use the enclosed email address rather than your reply button. Dealer enquiries are welcome.

- Last Updated 09/17/00
- Sold items removed

I have a limited amount of brand new Atari Jaguar items for sale or trade (these are not refurbished units). These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25 - Only a couple left

** Atari Jaguar Accessories - New**
==========
- Jaguar unit alone (No power supply, controller or accessories) $20
- Team Tap (4 Player adapter) $20
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $10
- RF Switch Box $5

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========

All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- An original Intellivision keyboard for the original Intellivision
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues 12 thru 20

Two books by Alan Clements might interest you

"68000 Family Assembly Language" ISBN 0-534-93275-4
A disk with a cross assembler/simulator for PC is included
"Microprocessor Systems Design 68000 Hardware, Software, & Interfacing"
ISBN 0-534-94822-7 comes with a CD ROM for PC

Gripping stuff, characterisation a bit weak though;-)

Regards

Mike Bedford

The following book describes in detail each instruction and addressing mode
of the MC68000 processor:

68000 Assembly Language Programming, by Gerry Kane, Doug Hawkins, and
Lance Leventhal, Osborne/McGraw-Hill, Berkeley, CA, 1981, ISBN: 0-07-931062-1

Be sure and get the first edition...later editions deleted a lot of the
examples and other useful info. I saw this book listed on <www.abebooks.com>.
The prices ranged from $50 to $10...pick the cheapest one...

My choice is definitely "68000 Sourcebook" by Alan Clements
It covers whole 68K family, although majority of the contents adresses 68000
and its close relatives, like 68008, 68010 etc.
Besides machine language stuff book covers topics like bus signals, history
of 68K, intentions of its developers etc. Definitely a "Must Have" for anyone
interested in 68K!
(McGraw-Hill, ISBN 0-07-011321-1)

Yes, there is. I have it somewhere on my backup CDs. There is free cross
assembler and disassembler for 68000. I think the name is (X)ASM68 . Try with
Altavista search.

| Hello, I figured the best recommendations would be from STers! I'm in a
|class that covers the motorola 68000 programming and internal
|architecture. Since the prof didn't even offer us a textbook, I would
|appreciate any reccomendations of a good book that goes over the 68K in
|pretty good detail. It need not pertain to the ST specifically, but it
|does need to go into pretty good detail on the addressing modes, explain
|what each instruction does, etc.

I didn't see the original of this but picked it up from someone's
reply.

I suppose the most detailed coverage of the instructions themselves
is in the official Motorola Programmer's Reference Manual.

One of the easiest books to read on actual programming is
Programming the M68000 by Tim King and Brian Knight (Assison-Wesley
1983).

The 68000 Hardware and Software by Patrick Jaulent (MacMillan
Computer Science Series1985) and 68000 Processor Handbook by Gerry
Kane (Osborne/McGraw-Hill 1981) include information on cycles and
timing.

The most academic book I have seen is The M68000 Microprocessor
Family, Fundamentals of Assembly Language Programming and Interface
Design by Yu-cheng Liu (Prentic-Hall Inc 1991).

I would imagine that any good university bookshop will have a
selection of books in their computer section.

Lyndon Amsdon (bindon@madasafish.com) wrote:
: I've just checked on the schematics and pin 27 goes through a gate
: (probably an OR) to the WD1772 INT pin and to FDINT on the ACSI port.
: So this could be the problem I'm experiencing with STinG as it's when
: I access my Hard Disk.

It would appear that the IDE interface you have needs this pin cut so as to pass the existing disc interrupt sources through an OR gate with the IDE interrupt, so as to get the IDE interrupt into the system. My IDE interface attaches to the IDE interrupt to the wire-ORed ACSI interrupt pin, so no pin cutting is required.

Regarding the other original queries, while I cannot guarantee that all hard disc drives will work, I am not aware of any problems except with the Western Digital drives. I have never had problems with the power supply or heat, but the 2.5" drive can use a significant amount of power and could potentially be a problem in some cases. A 2.5" drive fits perfectly behind the SIMMs, between the power supply and floppy disc drive in the STE, after being fixed by two screws through the plastic at the back. One of the plastic posts in the casing must be cut, though.

The only other point which appears not to have been covered is that there are a few STEs which have a surface mounted CPU, and in these models installation of the IDE interface is difficult. These models are unusual, but it would pay to check before ordering the interface. The CPU is a square chip in the lower right-hand region of the motherboard, with MC68000 printed on it (around other numbers).

Hi folks!

For sale: a good condition STE 520. Also going is a SM126 monochrome monitor plus swivel stand and both for just 100 ukp. Alas, no mains lead for the STE and the monitor connector needs attention but it's ten minutes work if you've a soldering iron and know what you're doing!

I've a load of software that I can copy as well if the buyer provides the blank disks. Great for someone just looking to start out in Atari computing or who fancies a low-cost pro sequencing setup. Buyer collects and UK buyers only please.

Get in touch if interested

The Digital Antic Project (http://www.atarimagazines.com) is proud to announce that the full text of every issue of Antic Magazine is now available on the Web. Devoted to the Atari 8-bit and ST computers, Antic magazine published 88 issues from April 1982 through July 1990.

This site launched with two issues on July 27, 1996. More than four years later, the project's volunteers uploaded the final issue. The site includes 1,700 articles, 2,400 images, and 1,600 downloadable program files, using more than 100 MB of disk space. More than 30 volunteers have contributed time to the project.

Although the Digital Antic Project has reached an important milestone, the effort is far from over. The volunteers have already begun digitizing two more magazines published by Antic Publishing: STart, which focuses on Atari ST computers; and Antic Amiga Plus, which focuses on the Amiga platform. (People interested in donating time or magazines to the cause are encouraged to send e-mail to savetz@northcoast.com.)

Thanks, all! With all the recommendations so far, I have no excuse for not doing well in this class :) Maybe I'll look back to this fondly when we reach the second half of the class, covering the 80x86 architecture.. I'm starting to see a common theme in the microprocessor classes they have at my school. last semester, it was MIPS in the first half, and 80x86 in the second half to show you how nice the MIPS is.. Now we're doing it all over again but with the 68K architecture as the hero and intel once again as the villain! I'm just glad that when we did the 6800, they didn't stick an 8080 in our faces.. :)

Hi Charles

Well if you try Splitter then it should work, at least it did for me.
When you drop it on Stuffit, drop the index file first, can't remember
if it was called 0 or 1, was some time ago. But when I did that,
Stuffit knew which the other files were. Happy splitting!

From july to september, the CT60 'First Design' received only 83 buyers
promises.
It's a pity to see a such low enthousiasm from the TOS community !
I propose now, with the 'New Design' a new approach, cheap and expandable.
This is my last proposition and I need at least 100 buyers to finish the
design...
The previous CT60 design is now dead !

Visit my web site at : www.czuba-tech.com
Dis you see the counter ? Not bad since July 1st....

I have noticed that your plans keep, changing.. and
changing... and then when you think it's ready... no it changes
again. There is a trend here and probably why you only have
83 buyers. Surely I am not the only one who has noticed this?
I imagine there are some people like myself who must see such a thing
before they will commit to a purchase. You are dealing with a market
that has heard many promises from many people over the years...
It only takes getting burnt once, and then promises mean nothing.

If your product is good it will sell itself.

Source record: 57301

Sorry, deleted the original so may not have got the header exactly.

If it is possible to construct a new superfast 68060 based add-on for a Falcon, is it not possible to produce it as a stand alone item? By that I do not mean an entire computer but a populated motherboard to which could be added graphic cards, drives, keyboard, case etc.

We have learnt that the Hades, though fast, has some fundamental flaws and I assume, though not an expert, that it is not as fast as a more modern design. Phenix is dead and it sounds from what has been written here recently that Milan 060 is going the same way.

I would buy a "better Hades" (faster, more stable). I would not particularly want to buy a modification for a Falcon as I do not have one.

Source record: 57302

Hi,
I've always seen accurate speed measurements with HOWFAST. Mind you that the Falcon's SCSI-prt can't go faster than 2MB/s regardless of the maximum speed of the drive itself, due to the SCSI-controller... :(If you use HDDriver, you can change the cache-settings in the drive itself to Read-cache only. Don't use Write-cache!
When I had my Falcon up and running with an accellerator before the accellerator broke down - old one called Speed Resolution - I reached about 2.9 MB/s on both IDE-drives (Quantum Fireball 1.3GB and 2.1GB), and about 1.9MB/s with the SCSI-drive - tried several different brands and models, including UW-disks...

Best regards,
Claes

I don't have of those, but I'd like to echo the sentiment for Analog,
which ranked right up there as a top-notch Atari magazine for many, many
years. I have about half the collection myself (40-50 mags, and growing
through Ebay - my goal is to get them all) and a scanner, and would be
happy to help.

No correct showing of jpg's in other than TC???
The only resolutions that aren't supported are 15 bits and 32 bits. In
256k, 16b and 24b colormode WS3 works just fine.

>I'm surprised they are developing after the slating they had from this

They are only working (?) on a French version. An English version isn't
planned at all.

For those who understand French I've include a part of the original
message from Oxo

Subject: Wensuite et le Javascript
Date: Mon, 31 Jul 2000 11:38:19 GMT

Bonjour,

Bref, c'est vrai qu'il y en a marre de ces incompatibilitï¿½s de sites
avec les browsers Atari. Sur Wensuite, nous sommes trï¿½s en retard sur
les derniers "standards", et c'est vrai que l'on ne peut pas fournir.
Je rï¿½flï¿½chi actuellement ï¿½ passer une GROSSE partie de WS IV en
"opensource", ce qui permettrait ï¿½ chacun d'apporter sa pierre ï¿½
l'ï¿½difice, et d'en faire bï¿½nï¿½ficier tout le monde. Qui dit "opensource"
dit aussi gratuitetï¿½ dans ce cas !!!

Le Java n'est, ï¿½ mon sens, pas utile dans le cas d'un browser, au
contraire du Javascript. Cependant, qui dit Javascript, dit aussi
compatibilitï¿½ Netscape ou Explorer, dit aussi feuilles de style, DHTML
...

La bonne nouvelle dans tout ï¿½a, c'est que la structure interne de WS
permet d'implanter tout ï¿½a sans modifications majeures. Par exemple,
l'"Open Display" (une technologie made in Oxo) est similaire ï¿½ du XML
...

Quand aux reproches qui nous sont fait de ne pas vendre nos produits ï¿½
l'ï¿½tranger, je me permet de rappeler que ï¿½a ne regarde personne dans le
sens que ï¿½a n'accï¿½lï¿½rerait pas le developpement, BIEN AU CONTRAIRE. Je
rappele d'ailleurs ï¿½ ce sujet qu'ï¿½ une certaine pï¿½riode, nous subissions
des attaques en rï¿½gle sur ce newsgroup de la part d'une certaine
personne, par ailleurs trï¿½s apprï¿½ciï¿½e sur les newsgroups ï¿½trangers, et
qu'il ï¿½tait hors de question de nous laisser dï¿½molir sans rï¿½agir (car
nous n'avions pas la possibilitï¿½ de nous dï¿½fendre aussi en anglais et en
allemand). A partir de lï¿½, j'ai annoncï¿½ publiquement que nous ne ferions
pas (ou plus) de versions ï¿½trangï¿½res de nos produits, afin d'ï¿½viter
d'ï¿½tendre la polï¿½mique ï¿½ l'ï¿½tranger. Cette remarque a fait ricanï¿½,
pensant que c'ï¿½tait du chantage. Mais bon, on ne va pas nous reprocher
maintenant de respecter notre parole.

Fabrice Bamas, gï¿½rant d'Oxo Systems

Its possible that something is corrupted on your machine, or maybe your IP has started using different software, as has happened to me on numerous occasions. Try reinstalling your .OVL file first, maybe check for an upgraded version whilst your at it?. Then reinstall you browser software.

Thank You Kevin and your great team for keeping this up for so long.
It is so hard to find Antic magazines now, And your webpages fill the
gaps in my collection, allowing access to those mags, I probably never
will ever find.
The effort gone into the archiving of Antic is very much appreciated
by myself, and I know it is appreciated by many others too.

Thanks again,

Aaron

Hi all,

can any one help.

I pre-type a message in qed for aMail, save and quit, click on (send) later and quit amail.
I then open aMail and send the message. all's well so far. however when I want to quit aMail
I get the message aSock still running, why, the message has been sent?

Bob

Hi charles,

Yep I use Newsie, its all there is in reality! but I use aMail for e-mail and
aFTP for geues what ftp, trying to use aFTP from within CAB 2.8 always give me
a 'can't form file' type of error. I use qed as my editor. If the line is
dropped while typing, I just Save and Quit and click for send later - no hastle.
Had two intersting e-mails with attachments from work using Netscape. One had a
multimegabyte AVI movey of a Tesla coil in full action with sound. Able to display
and hear with Aniplyer. Second was an e-mail which should have had GIF forn=ming
the background. aMail not up to that, just showed GIF as an attachment. Very
pleased about the AVI. I will send it to you if you like, takes a while though!!

Bob King.

Way to go!

400 years from now, our descendants will load the data into their holograph machines, walking into a virtual room to pull a copy from the shelf of 88 mags. And the C64 crowd will just have to suffer 'cause all their magazines rotted!

I totally agree with you, especially about J.D. Casten! He my favorite Antic game programmer. I never did finish Escape from Epsilon! And Max B. was very clever.

Anyone know what he's doing these days? I didn't see his name in the "Where are they now?" on the DAP site. I sure hope that he's working in the games industry somewhere. He sure had a talent for it!

And I flat out won't buy anything I don't see first.
That is my right as a consumer. The Atari market is not
a good one for promises or polls. It would not suprise
me if there was enough people with the "see it first approach"
to take that number well above 100. Obviously the maker
has just as low expectations to yank the idea so quickly.
I have waited to many times for things that don't appear, and so again
another one. On top of that from the same individual. See only
what you want to see... that too is a trend around here. What good
is a site full of vaporware projects.

If you don't mind soldering a lot of tiny wires, it is possible to
install a non-EDO SIMM from a PC in a 1040ST to get 4 megs. There
was an article in the German magazine ST Computer on how to do this
a couple of years ago. I have personally done this to two 1040's
but no, I am not volunteering to do it again.

I wonder if the problem is one of trying to do too much with a single design. I can't speak for anyone else but I would be happy with a single user, monochrome, high resolution, TOS based computer. It would have a 68060, up to e.g. 128 MB memory, modern SCSI interface; all as fast as possible and be stable. I am not aware that having acess to a PCI bus helps at all. I am not certain about USB. Obviously it is popular.

The Hades is fine but I suspect the new designs have faster processor and memory and certainly I have had problems with the SCSI interface to a scanner.

Since TOS exists in various forms on ROM at present would it not be possible to select one suitable version (3 or 4) and use that as the operating system?

Jo,

I think your math is wrong.. The price of the CTT is 150 Euro Dollars. If you convert that into US dollars its about $128 US Dollars.Seems somewhere

you lost about $60 US Dollars. The current rate is about $1USD= $1.18 Euro.

I emailed about the CTT and he replied saying he would go ahead with doing the project if I was interested. He had 15 people on the list I guess that would make me 16. I was and still interested but, I really hate hacking on my TT motherboard.

Don

>
>Good work Rudophe! You have one supporter here!

A year ago Rudophe announced he was working on a acceleration board for the TT. Just like with the CT060 he needed 50 buyer. Although there were more then 50 (according to some rumours) possible buyers he didn't release the card at all. The same happened with some other projects too. Some people says he release vapourware and to be honest I start to believe then. None of his announced projects saw ever the light.

2939. TT Monitor Pinout

Newsgroup: comp.sys.atari.st
Date: 2000-09-20 00:00:00 UTC
From: jlog@zetnet.co.uk
Message-ID: <39c86fe8$0$8004@news.zetnet.co.uk>
Source record: 57318

Someone was asking for the TT monitor pinout. The connector is a
High Density DB15 and the connections are as follows:

1 Analogue red
2 Analogue green
3 Analogue blue
4 High resolution monochrome (ECL)
6 Ground
7 Green return
8 Blue return
9 Monochrome monitor detect
10 Ground
11 Not connected
12 Not connected
13 Horizontal sync (TTL)
14 Vertical sync (TTL)
15 High resolution monochrome (ECL)

Symmetry would dictate that 6 should be labeled "Red return" but
this is not what the manual says. I presume in practice returns and
grounds are the same.

>to Read-cache only. Don't use Write-cache!

Why?

Enabling the write cache *in the drive* gives a huge performance boost on
many drives, and is a low risk compared to any kind of caching in main
memory.

Isnt Pro-sequencing software commercial, and therefore something that shouldnt
be offered as copies?.

True enough, but I've heard it said before that if the ST software in question is
now longer actively marketed by its makers, then no-one's being robbed really.
Certainly people have offered me disks of well-known commericial music software
for buttons...

Anyone interested (still) please get in touch

Cheers and keep the faith!

I just disabled Cecile and use HDDRIVER (7.8 I think) instead.
But I had to throw away the original IDE drive because HDDRIVER
does not know the special slow access mode Cecile has built in.

Hi all:
and for those who don't understand (including moi), a machine
translation:

"In short, it is true that there is enough of these incompatibilities
of sites with the browsers Atari. On Wensuite, we are very late on
last the " standard ones ", and it is true that one cannot provide. I
considered currently to pass a LARGE part of WS IV in " opensource ",
which would make it possible each one to add its contribution to the

building, and to make some profit everyone. Who known as " opensource " also says gratuitetï¿½ in this case!!!

Java is not, with my direction, useful in the case of a browser, on the contrary Javascript. However, which says Javascript, known as also Netscape compatibility or To explore, known as also style sheets, DHTML...

The good news in all that, it is that the internal structure of WS makes it possible to establish all that without major modifications. For example, the "Open Display " (a technology made in Oxo) is similar with XML...

When the reproaches which are made to us not sell our products abroad, I allows itself to recall that that does not look at anybody in the sense that that does not accï¿½liï¿½rerait the development, Quite to the contrary. I rappele besides on this subject that at a certain period, we undergo attacks regulates some on this newsgroup of by certain people, in addition very appreciated on the foreign newsgroup, and that it was out of question of letting to us demolish without reacting, we did not have the possibility of also defending us in English and in German. From there, I publicly announced that we would not make > not (or more) foreign versions of our products, in order to avoid > to extend the polemic abroad. This remark made laughed, > thinking that it was blackmail. But good, one will not reproach us > maintaining to respect our word."

'nuf said,

Bob King.

Lo:

The computer is searching between the internal drive and the external or
if you have the original 520ST it has no internal drive but.. keeps
checking back and forth tween the drive and it's setup...

It is faster if you put a readable disk in Dr "A" and perhaps drive "B"
or... if it only has the 1 drive put a disk in it.

To transfere files tween ST and PC there was a way to use no-modem cables
Software was needed though... and cables Eh
someone here must still have that knowledge

There is also a problem created if drive "B" is in the off position.

The ST can read IBM disks (720k) but not the 1.44 IBM's, that requires an
IBM drive and knowhow...

If the drive's are single sided, there is more complexity...

One needs software to read and display Image files on an STfm

Am sure some file-transfere-site has these

1) Why shouldn't he try another spec when nobody is interested
in the old one ? If you propose a product and there's not
enough people interested in it do you stick to it regardless
of the economic desaster that's likely to happen ?

2) What's wrong with asking who would buy a product before
manufacturing it ? If he'd first let it build and afterwards
wait for customers he would have to make it much more expensive.
I bought one of the CentRam cards he supplied a few month ago
using the same scheme. Since he knew exactly how many pieces
he'd sell he could let manufacture the exact number of pieces
and so they were quite cheap for us. Of course we had to wait
whether there would be enough buyers but what's the problem
there ? Being on a list of interested people doesn't cost anything.

3) I won't buy a CT60 but the only reason is that I'm very satisfied
with my CT2 falcon and don't want to throw it away and don't have
room enough for a second falcon.

Hi all,

just to add a little bit of support for Rodolphe's caution.

He is after all a professional producer of hardware in a minority and
shrinking market. He does not just produce software, which Lord knows is
hard enough and a thankless process in itself, but at least does not
take money, only time and intellect . Hardware development on the other
hand takes at least the cost of the prototype production, and the
hunting around for commercial producers willing to tool up for a small

to medium hardware final product run (look at the trouble Milan/Axro are in with their Milan II production). On top of this, if there is anything truly novel in his design he will have to consider IP protection, and that I can assure you costs ï¿½1000s. What is Rodolphe to do, pay for the production of a limited run of beta type CT60s, out of his own pocket just to give these away, in the hope that the recipients of his benevolence will say ï¿½yes wonderful, we will pay for and keep'. Prior form makes likely a best scenario of a long winded backwards and forwards list of requests for adding this and trimming that, all the time the clock is ticking and the interest on his loan mounting. He would basically be a bloody fool not to seek some form of insurance in a FIRM list of customers, if he didn't, I expect his bank manager would.

Bob..

Could you describe this aftermarket card and
advise as to its availability? Sounds like it
gives you '100mb' of ram using (which?) memory
chips. Will it work on a basic Falcon or is it
only for 'CTx' Falcons?

> 3) I won't buy a CT60 but the only reason is that I'm very satisfied

If you list your Atari configuration(s) in your
sig, it is easier for outsiders to keep up with
what is currently working and available. Thus it
is more than just shameless self-promotion. :)

Hello All

One of my Atari-Midi members is getting frustrated that he can't run some of the mem-hungry midi apps on his 1 meg 1040ST. What he needs is a 4 meg machine.

Can anyone help here?. He has tried on Ebay, but 4 meggers have been going for outragious prices which he can't afford.He is in the USA.

Or...can a 1040St be upgraded to 4 megs? another alternative.

Thanks for any responses.

Tim Conrardy

I would like to invite anyone of you to the Atari-midi mailing list.

Hmm thats interesting. How does he get around soldering as IIRC
Mario's is said to not require soldering. I thought Mario's was
simply a plug over the top of CPU type job, but I'm wrong.

I'm going to see what speed disk access I can get, compared to Marios
and maybe the C't. I'm interested because mine (TUS) needs 16mhz from
the shifter.

I do have a TT but a later post suggests that the C-TT does not have
a 040 or 060. Would it not be easier to design a self-contained new
board rather than trying to adapt a design to an already existing
computer. After all, the add-on seems to have processor, memory etc.

This is very old news. It will probably never see the light of day,
Rodolphe asked for a certain amount of committed buyers before he would
make even one card but I don't think the interest was high enough. Not
really a big surprise, from the mail I received on that project (I can't
remember if it was from Rodolphe himself) he wouldn't base production on a
poll, but a certain amount of people that would commit to buy the CT-TT -
before it even existed.

I can understand that Rodolphe doesn't want to take any chances, but this
is not a very realistic business-model.

I have also received this error for quite a while now but _only_ with Dan's OVL. When using Olivier Booklage's OVL I don't seem to receive this error at all. Maybe you could try Olivier's just to see if you find the same thing. I have contacted all concerned but atm it seems a dificult one to crack. If it's any relief, you are not alone here! ;-)

Best Wishes

Maybe you missed some of the other posts but I had heat problems with
_3.5"_ drives in a ST case! 2.5" drives generate very litlle heat.

Congrats! Antic was definitely my Atari resource way back. I did buy
Analog from time to time, but Antic had that warm 'n fuzzy feel to it
that Analog lacked, and it had game type-ins that were much more fun.
Particularily those by J.D. Castin -- Rebound was probably the best
type-in I spent hours doing, followed by its construction set. I had
loads of fun with those...

Then there was mini-golf and its construction set... ah, the memories.
:-)

No wonder considering that most of the commercial market is corrupt and regularly rips off it's customers. I would never commit to buy something that doesn't exist yet, especially not when not even the specs are definite...

I like to play it safe - and I do have a UPS on my computer at home -
and one for the rest of the home studio too... ;)
I never noticed any difference in performance when I tried with/without
the write-cache - on several drives. The Falcon's SCSI-port can't go
faster than 2MB/s due to the design (theoretically 2MB/s - in real life
it's slightly lower), so I guess that the drive doesn't notice the
difference - the data probably never comes in such a high speed that the
cache is actually needed... The risk of loosing data in some situations
seems to be larger than what you might gain from using the write-cache.
Besides - Cubase Audio is always a little picky about details - it may
work with some HD's and not with some, so it's safer never to use the
write-cache at all. If the write-cache is disabled, you'll get all the
cache in the drive for read-cache instead, which might increase the
performance when you read several audio tracks at the same time - and
that's more important since you probably need more power for replaying
all the already recorded audio tracks than for the one or two you record
at the same time (yes, I know that writing is slower than reading on all
drives, but I still think it's better not to use the write-cache)...

Escape was an excellent game, too, and another I enjoyed immensely.
He may have used redefined character sets, but his games *always* had
fantastic gameplay -- and replay value. I played Rebound not too long
ago, and for the first time in may years, and it seems my reflexes
have slowed down since the first time I played them, 'cos frankly, I
suck at that game, now. :-) But it's still lots of fun.

Another of my favourites was Uncle Henry's Nuclear Waste Dump, which I
thought was really very clever. I was working on an updated ST
version of that years ago. I got as far as having done all of the
graphics, animations, and some basic code down for displaying things
and moving the crane around before I unfortunately left the ST scene.
I'd still like to remake it, though...

>Anyone know what he's doing these days? I didn't see his name in the "Where
>are they now?" on the DAP site. I sure hope that he's working in the games
>industry somewhere. He sure had a talent for it!

It's funny, but I seem to recall hearing something years ago, but I
can't remember what. (my mind, as well as my reflexes, has degraded
since then, too. :-)

He mean's don't enable write cache in HDDriver - main memory caching. Which I never do.

> Enabling the write cache *in the drive* gives a huge performance boost on
> many drives, and is a low risk compared to any kind of caching in main
> memory.

This is what I was saying - the on drive cache is causing rateHD to misreport.

Hi Ken, and all who have responded.

First: he has a 1040Stf to answer one question.

Second: Outrageous prices would be between 300 to well over 500 dollars. (that is 1040 Ste's or mega Ste's.) However that includes monitor and mouse. Comparitivly, a mac IIci goes for less then 20.oo! Also look at TT's. They go over 1000.00! That is OUTRAGEOUS! Why the hi ticket prices on Ebay for 10 year old technology? (don't get me wrong...I love the technolgy!! I have 4 atari computers set up in my own studio!) It used to be where you could get an atari sytem next to nothing. Now they are skyrocketed out of reach for some one who could use it for an excellent midi system, but can't afford the hi=ticket and configuration problem on PC/Mac.

Tim

I would like to invite anyone of you to the Atari-midi mailing list.

It was a lot more back then, 50 or 100 IIRC.

> have 20 TT users in the world that wouldn't buy it? If the price is

Probably, but hopefully there's not that many *stupid* TT owners who would
committ (too many m's or t's there?) to buy a piece of hardware that
doesn't even exist yet. I would certainly buy one of those if it...

a) ...worked.
b) ...was reliable.
c) ...doesn't need irreversable changes on my precious TT.
d) ...was compatible with the software I use now.

It's difficult to judge this if the product doesn't even exist.

> right on his site.. that's $70 US$. I'll buy one!

Hmm, $70? Then why doesn't he just make a batch? Mario Becroft has made
more expensive hardware than this for the TT without pre-orders.

Hi. I have been searching for sometime now for the "fdisk" hard disk partitioning software for the Atari ST version of Microware Personal OS-9/68000 V2.2 (3 disks). The file 'fdisk.prg' from the startup disk has been damaged and I have no backup for this disk. Could anyone provide this file?

Thank you. Carlo.

Yes STE's and Mega STE's do fetch more than STF's! as they are easier
and cheaper to upgrade, run slightly faster, have DMA sound, hardware
scrolling and a few other bits and pieces.

The STF's I've come across have all run under TOS 1.09. Another drawback
is that they have no internal modulator, so running on a standard tv is
a problem.

But even today's technology can't deliver a rock solid operating system
with MIDI built in as standard, without any special drivers and you
don't have to wait that long to be up and running!.

I'd rather stick just my Atari and hard drive in a bag rather than a pc
case, monitor, speakers, keyboard... OK there are laptops, but the midi
on the pc is not the best thing, unless you've got plenty of dosh!

2986. FA: PGS MAX-15 Multisync (15.75KHz capable)

Newsgroup: comp.sys.atari.st
Date: 2000-09-21 00:00:00 UTC
From: lonniemcclure@prodigy.net
Message-ID: <MPG.1433d0a54ed3a3b59897e5@news.prodigy.net>
Source record: 57219

The starting bid on this item is $4. I have listed it before and received no bids, so if you want it, it appears there is a good chance you could win it for the minimum bid.

There is more info, including pics, video input pinouts, etc. in the listing at eBay:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=444453112

As noted in the listing, I don't have a cable to plug this monitor directly into an Atari ST, but if you win the bid and mention it is for an ST, I will include a DIN-13 plug to help you on the way to building a cable for it.

As this monitor handles scan rates from 15KHz - 36KHz, one could also rig a switch on the mono detect line that would allow it to be used in all 3 resolutions.

For TT owners or Falcon030 owners with the VGA monitor block, a HDB-15 cable is included with the monitor.

This monitor is one of the few multisyncs to also accept composite input. It is, however, a monochrome monitor. OTOH, gives the best clarity (as SM124 users can attest), and this monitor has a significantly larger screen than the SM124.

This is the same subject. I've read all the posts thus far in these message strings referring to Rudolphe Czuba's projects. Why the hell is everyone so damn negative? I mean, the guy is trying to provide some accelerators for some obsolete systems. I happen to own a TT and I do not have any options for accelerators (except Cattamaran maybe?). And you know what, I think my Atari is too slow. I can't even stand watching the web browsers try and format a page. tHere's not enough time in the day.

So this is trying to bring a solution to market. And yes, he's asking for people to commit to purchase by e-mail. But has he sent me a bill yet? No. And have I had to send money in order to insure that the project goes forward? No. All I had to do is say that if he did produce a working product I would most likely purchase one. That's all. And from what I've seen, this guy has not run away with anyone's money yet. Sure some people have done this and tainted the Atari hardware market. But he hasn't yet. Should he get a reputation based on other people's actions?

I support his projects. And if he produces the batch of CTT boards, I will pay for mine when they are ready to ship. No earlier, of course. That ony makes sense. But, like I said, I don't believe he has asked for up-front payment.

I'm sorry if I did upset anyone or hurt anyone's feelings. This was definitely not meant as a flame. I just don't want the few negative comments about Czuba's projects to stop the projects altogether. I just want a faster TT.

Thanks for your time everyone! Just thought I'd givce my 2 cents ;-)

I've learned that if you want to get something for a reasonable price,
don't go to Ebay. I don't know what the phenomenon is on Ebay, but
the huge-audience auction format generates enormously inflated prices
for just about everything. Great for the seller, bad for the buyer.
I'll bet that $20 for the Mac wasn't from Ebay.

But back on topic, I've got a Marpet memory expansion in my STfm, and
have been very pleased with it. The only disappointment is I don't see
how I could add Mario's IDE adapter. Oh, well. Is the Marpet still
available anywheres? I'd recommend it to anyone wanting to upgrade
their ST. Very easy installation, good instructions.

Also, I don't know if anyone else noticed this, but as far as the CT60 goes, his required number of potential buyers has constantly been increasing. He started out saying it'll be produced if he gets 50 buyers, then 70, now 100. Each time we've reached the "magic number", it goes up. This is discouraging.

Also, on a more personal note, he's said some very rude things to me that have kind of turned me off to his products. I asked some very simple questions, like "Would the CT60 work with Nemesis?" since I was once told that the Nemesis is next to impossible to remove without damaging the motherboard, and "How can I tell the difference between an ATX powersupply and others?" since that's what was required of his original design, and I have no experience with PC powersupplies. He replied with extremely rude and insulting comments basically implying that I was stupid not to know these things, and why would I want a Nemesis anyway, and haven't I seen an ATX powersupply before?!?!?! So trying to put a positive spin on this, I had hoped it was just liguistic problems with something getting lost in the translation. I E-mailed him back letting him know that this was how it appeared to me, but I was just checking again to give him the benefit of the doubt, and he returned with another insulting E-mail. So at this point, he would have to come up with something pretty darned impressive to get me interested again. I just hope Cortex gets things back together with the Tempest card, so I have at least SOMETHING to upgrade my Falcon with.

Anyway, I'm done with my ranting fit... :)

nameerf@flash.net
:)

I think your much safer removing a Nemesis than trying to take a CT2B Falcon back to stock configuration without the Falcons SMT 030 on the mainboard:)

I don't know what the final price for the CT060 card would be, but lets say he can have a "final" design PCB prototyped for $125.00 each. That may be high, depends on the quanity of the run. If there is a design flaw, he has to fix, say, all 100. Time wise, probably best to have a short run to test the concept, then have the final boards made. Add the logic cmos and flash ROM SMT devices, SIMM socket, PLCC socket for the 060, headders to mount to the Falcon expansion bus, oscillator, SMT resistors, ect..... could get expensive just to make a 100 cards. Then, IF you can find 100 68060's in one spot, your surely going to pay over $150.00 each. The lead time for those runs in the years if they have to be ordered..... Just guessing, but looks to me like the price is up to around $300.00-$350.00 USD, plus a floppy, manual, box and static wrap. The guy honestly must do it for the love of labor, as it doesn't look like much profit could be had.
The CT2 concept (flash ROM, and just the manufacture of the card itself aside from any other technically superior intergration methods to the Falcon (or inferior, depends on how you look at it)) is probably better than the Afterburner design, but the Afterburner can almost be (actually was) produced in a garage. It would be much less expensive for someone technically inclined to "copy" the AB design, consider the changes needed in Logic to acomodate the 68060, and have them reproduced. There is nothing expensive about them, they are reliable, and easy to fit (if abit large).
The last Rumor that I heard about GE Soft was they had to file bankruptcy, and that the last run of AB's was actually produced by one of the other popular German Electronics shops that happens to also deal in Atari products (MW Electronics?, the name escapes me ATM). Maybe Gehard took the design to them, and let them make a buck (or mark) off of it. I doubt that anyone would care. They would have to have the equipment to read the programmable logic off the card (the AB has it's bus sizer done in software, bad idea, but cheap).
Maybe this rumor was bad. Who knows. Waiting for something that doesn't exist is something that everyone in this group is use to. Problem is, most of these young college types that design a computer for a project generally loose interest in Ataris before walking the walk, and that just leaves us hackers to fend for ourselves.
Anyway, i'm still hacking the Afterburner. When Petr gets time to finish a ROM image for me, maybe the world will see the first Falcon 060.

Lost in Space, and as usual, excuse the spelling,

Mike

Hi Jeffrey,

I hope you didn't include me in your 'negative' assessment!!

As I've said in this news group before, there seems to a complete blindness
on the part of a large section of the Atari community to some simple home truths:

a. the Atari market is a minority market, verging on the hobby,

b. as a result of a. no manufacturer large enough, ie with other lines to
fall back on, is going to mass produce low priced, ie comparable with the equivelant item
in the PC/Mac world, innovative goods for the atari market. New items, hardware
and software for the PC/Mac market are produced and sold in 100,000's or millions.
This is what keeps their price down.

c. the golden days of 'Power without the Price' died long ago. There is another
'mail in this NG, complaining about the very high prices asked for 'new' atari goods,
that's the supply and demand, market driven world we live in. If it's still 'Power without
the Price' that turns you on, then get out of the Atari market and get a PC/Mac.

d. any new software of hardware for the atari or clones is going to be dearer than its PC or Mac
equivelent, the producers are out to make a profit and the smaller the market, the more per good will
that profit have to be.

d. sure there have been some rogues in the Atari market, offering 'vapourware',
there are even firms of some considerable repute and with first class innovative goods
to their name, who, possibly because of unwise and/or inadequate foreward planning, look
as if they will not be able to fullfill their promises, but that is no reason to distrust
every one,

e. we should at the very least give people like Rudolphe the benefit of the doubt.If you object
to what you think is taking a gamble on his honesty, then what the hell are you expecting from
him but to take a gamble on you. It will cost him time, sweat and money up front to produce the goods that
you want to sample before you may buy or may not buy. All he is asking from you is a promise of an interest,
no money is at risk, at least not yours.

Bob King.

Hi,

Regarding Tempest (and Expose), I went to the newsgroup
comp.sys.atari.announce and there was info on Titian's progress.
They don't have any updates on their web page, but the newsgroup
article had an address to go to for lots of info. Worth checking
out.

Clayton Murray
Seattle, WA USA

newsgroup article follows:

*Kevin Savetz says:
*
*Are you dissappointed by the little information
*that is available on the net about the two latest
*Falcon030 hardware developments, the PowerPC
*accelerator Tempest or the PCI-Interface Eclipse?
*
*No need to be dissappointed anymore. There are
*pages about all the Fmax-projects by Cortex Design
*and Istari Software available now, featuring
*everything Oliver Heun could squeeze out of the developers,
*preliminary benchmarks, specs and technical data.

Hello All:

Go here:

Sound On Sound Magizine

http://www.sospubs.co.uk

Click on the picture of the new issue. Then Computer notes, Then
Atari Notes.

You will see an excellent review of David Snows Atari-Midi apps now
freeware.

Midi Master Drummer will be next issue!

GOOD JOB DEREK!!

Anybody hear of David Snow's Stuff or use it?

Tim

I would like to invite anyone of you to the Atari-midi mailing list.

Hello All

Just got Calamus. (I answered that post a while back on that guy in Sunnyvale, CA, USA who was giving away his Atari stuff. Calamus was part of the package along with 4 monitors, a laser printer and a mega 2 and STf!)

I was wondering if there was a way to EXPORT a Calamus Document to either HTML or RTF/Word Format.???

The reason being is that I would like to have the TRACKMAN DOCS available for those that do not have Calamus, as they are available only in Calamus format.

Thanks in advance

Tim

You hit the nail right on the head. In fact 100 committed sales
is probably no risk at all for Roudolphe, so you have to wonder
where the lack of faith really sits. Mario can't get some of the
stuff done fast enough to meet demand.

Not to mention if said product will even hit my shores, which
further reduces the chances I'll ever see it. The only item
I've seen hardware-wise actually running was a Hades060.

If you wish to confuse being negative with being realistic
well that is your option. You have to question what good
is a site with vaporware projects. I could easily come up
with designs, put them on a page and make up prices. So
far the only use they seem to have is to let Czuba
vent his frustrations on us the users, they don't exist
and it's our fault... we won't commit... blah...

Which printer? Best Electronics and B & C Computer have both. And,
if it is a SLM 804, any office supply store has toner, and perhaps drums.
for a TEC LB 1301, which went into half a hundred different printers.

Well...I would have to agree with you there. Especially since all this
nice Atari-Midi Freeware is being released it has really pecked the
interest of midi enthusists and people are looking for ST's just to run
these applications that you won't be able to find the likes of on other
platforms.

Yes the flaws are there, but they do not get in the way of me using my Hades to it's fullest. I would love for it to be faster and would gladly upgrade to a better version, but for now I will stay with what I have.

>I would buy a "better Hades" (faster, more stable). I would not >particularly want to buy a modification for a Falcon as I do not >have one.

Actually the Hades is pretty stable as it is. It really depends on what OS you are running. I have found Geneva to be the most stable, but I still use Magic most often.

Well Lonny you can come over and see my hades in action anytime you want. You live in Ohio and I am in Northern Indiana near Notre Dame. Maybe after you see it you will want to order one eventhough you would have to get from overseas. I still say ordering the just the motherboard with TOS/Ram chips installed is the way to go. Building the computer would be simple.... It is the cheapest way...

if it's an SLM 605, even more good news - those printers were
manufactured by Epson, and therefore use Epson toner and drums.

last night at our TAF meeting, one of our members mentioned that he
had no problems finding the toner for his SLM.

> It was not possible to find any help in Russia.
>
> Konstantin

Hi Konstantin,
Buy a regular PC-drive where you have a jumper that enables you to choose between "DS0" (Drive Select 0) and "DS1". As default, all PC-drives are set to DS1, while the Atari needs it to be DS0. Next thing to do, is to twist the flat ribbon cable (!!!NOT the 4-pin power connector!!!) the "wrong" way around according to the guiding ridge on the connector. Violï¿½ - you've got yourself an Atari drive - well, almost... You may have problems with disks that don't keep to the standard format 720kB - and in some computers, a disk change won't be recognised until you press <Esc> to force media change - but otherwise there are no problems - even though the PC drive is 1.44MB instead of 720kB.
Remember to check for a jumper to select the correct drive unit number before you buy it - without such a jumper, it's probably very hard to find out how to do it!

Best regards,
Claes

Hi,

My name is Odisseas Kosmatos. A long, long time ago I wrote some Atari ST "online games" that people who run Atari ST BBS programs could run so that their users can play games ("doors").

The one I am writing about was known as "Mount Neverest".

I lost the source code to Mount Neverest, but I think I might be able to find the actual package somewhere on the net. I need the installable package so I can confirm the copyright I had on it... and then proceed to put the game online on the web.

Does anyone A) Know where I can download it (I had even uploaded it to CompuServe back when I released it)
or B) Know where I can get atari ST files that were widely available in the past?

Thanks!

Odi Kosmatos

3017. NEW David Snow Atari-Midi Apps on TAMW!

Newsgroup: comp.sys.atari.st
Date: 2000-09-22 00:00:00 UTC
From: Tim Conrardy <tconrardy@hotmail.com>
Message-ID: <8qevn5vnu1@nnrp1.deja.com>
Source record: 57252

Just got some NEW Apps from David Snow tonight. So I did not waste
anytime, but quickly did up the HTML and put them on my site.

The new ones (released as Freeware) are:

Phraser, an interactive real-time MIDI file generator for the Atari
ST/TT/Falcon family of computers
by David Snow

Instant psuedo-12-tone composition is here! Hook up a MIDI keyboard
to your ST's MIDI output and double-click on PHRASER.PRG. At the
first prompt, enter a tempo (beats per minute) value. At the second
prompt, enter a beat-subdivision value (2=eighth notes, 3=eighth note
triplets, 4=sixteenth notes, etc.). Start playing single notes on
the
MIDI keyboard. Phraser responds by creating random phrases triggered
by the notes you play. Note density is controlled by how loudly you
play. To quit, press the Esc key. You can save the performance as a
MIDI file, or click on "Cancel" in the file selector to discard it.

NEW WAVE
A MIDI Sound Design Tool for the Falcon030
by David Snow

New Wave is a GEM application that allows you to create original
16-bit sound files using a powerful technique called "additive
synthesis". New Wave samples can be downloaded to any sampler or
sample-player that supports the MIDI Sample Dump standard, and also
be saved to disk in Sound Designer format. Even if you don't don't
own a sampler, you can still audition the samples you create.

1) at least one of these vapourware projects runs in my falcon
and was the best investment on any atari item I ever made

2) if I were Rodolphe I've had been fed up long time ago and
deserted the atari market. I find it very strange to let out
an endless stream of insults on him and his ideas and then
act offended if he is not willing to risk lots of his private
money for you without any safety net.

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

am swamped and I find it hard to keep up with reading the NewsGroups.

Wanted: Mega ST4. Willing to pay up to $100 U.S. Read on if interested!

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

Is it possible or legal to burn eproms with the tos version
I reqiure?

Is it a matter of getting a 27C256 eprom and writing the
tos version i want and plugging it in?

Atari's I'm talking about are STe STfm, and MEGA 1.

That's entirely the buyer/bidders fault. You'll find this
phenomenon at live auctions as well.

So if you want a bargain, don't go to any auction. <G>

The Epson Action printers were a TEC engine also. Once I learned this years ago, it made sense why Atari was able to use the same controller for both the 804 and the 605.

You never know what's behind the scenes. I've owned and HP Laserjet 4 since almost when they first came out. I didn't know until this last week that Canon marketed a laser printer that uses the same toner cartridge. Then I also remembered that Canon has made a lot of the print engines for HP lasers. Or at least that's what the biological memory banks say. <G>

No hang on a minute! Seeing as how our platform is not what you'd call at the very forefront of technology any longer, isn't this a bit pointless? I'm trying to get someone else involved with Ataridom who might otherwise be lost to Mr Gates so implying that I'm a criminal is a bit strong! Besides, are you really saying that you have never copied something and given it gratis to a friend? This 'we need our revenue to develop new bands/write new programs' stuff seems a load of crap to me - very EMI. Witness Napster. Who really owns anything anyway, especially anything creative?

Careful what you say about thieves: I think libel still applies...

Hi Gerhard,

It's nice to know that there are at least three of us in the 'Give Rodolphe' camp.

If you read my postings of 20 and 21 Sep, you will understand my puzzlement on Lonny Pursell's exhortation for 'realism', when IMHO it is he (and others) who are living in the cloud cuckoo land of yesteryear.

And yes, I am posting my interest to Rodolphe in his CT60.

Bob King.

The chip is a 68882, and the "16" in the chip number indicates 16 MHz.

AFAIK, most 68k-family chips have their speed rating in the chip number.

(Based on casual observations of 68k chips over the last decade or so)

3031. ZIP drive has me baffled

Newsgroup: comp.sys.atari.st
Date: 2000-09-22 00:00:00 UTC
From: Ken Springer <wordworks@greeleynet.com>
Message-ID: <39CB6EA6.75DB758C@greeleynet.com>
Source record: 57266

Hi, All,

Well, my ZIP drive has me baffled. It won't read *some* of
my TOS & DOS compatible ZIP cartridges. :-(

The computer is a Hades 060 and HDDriver 6.22 or 7.54,
external SCSI ZIP.

A couple of years ago, I bought a package of ZIP Carts after
I bought this windows machine. But I never took the time to
make them TOS and DOS compatible. I had space on older
carts that I had already made compatible. Now I need some
more compatible disks.

So I went to the Hades, *thought* I had made them
compatible, but the Hades cannot read them. At first, I
just partitioned all of the thinking that should be fine, it
wasn't, and then I actually formatted one, partitioned, and
it still wasn't. Yet I can take any of the older disks and
the Hades sees them just fine.

I also have a TT at work with an external SCSI ZIP. I
haven't taken any of the disks that cannot be read by the
Hades out to work yet. That may be my next step.

Does the Hades/HDDriver combination have problems creating
TOS & DOS compatible ZIP carts? I've read Uwe's posts about
no longer officially supporting the Hades due to cache
problems. Too bad they will never be fixed, AFAIK. :-(
I do not remember which computer I used to create the carts
that can be read.

Hopefully Uwe will see this post and offer some suggestions.

Thanks,

Ken

3032. New Milan 2 rumour

Looks very confusing... The only reason for doing something like this
AFAICS is to be able to use faster and cheaper CPU's (PPC, Athlon or
something like that) by running a 68k/TOS-emulator under a
Linux-kernel. But why develop a Milan in the first place then, a
bog-standard PC would be *much* cheaper?

I have a Marpet kicking around, with two 256k simms for getting a 520
up to a 1040. What do you see as the problem with the Marpet and the
IDE board. The marpet hogs the MMU and shifter and the IDE board uses
the CPU. Shouldn't be a conflict hardware wise.

If it's space I bet it would fit if you removed the old shielding. I
did this on my STE and it didn't seem to affect near by TVs or radios.

Hi

Good point, not having used Cubase I was unaware of the range of formats
used:) The format I need is for the .ARR files.

Cheeers!

Hi

If I try and understand what you are asking, you want a way of
transferring data between your Atari and PC using floppies!

If this is the case, all you need to do (if you don't have access to an
Atari, but then how would you transfer data!!) is format a DOUBLE
DENSITY (720k) disk on the pc, you will then be able to read and write
to that disk with the Atari.

Now formatting on the pc is alright, but you only get the standard
format and space it gives you. So why not use a program on the Atari
which allows EXTENDED formatting, for even more valuable disk space!

I use DC Format 3.0 to format via my ST's using an extended format, or
just standard if you prefer:)

The program can be downloaded from my LaST PD library web site:

For the sake of clarity: There is no such thing as Euro Dollars - just
Euros! The symbol is a C with an = sign in the middle. Can't reproduce
it on screen but have included it in some printer drivers as C BS =.
Later fonts have it in their set, but you need means of accessing it.

Regards, /Peter/

|here recently that Milan 060 is going the same way.
|
|Yes the flaws are there, but they do not get in the way of me using my
|Hades to it's fullest.

Firstly it stops me from using my scanner in the way that I want. I
can only use a maximum width of about 4000 pixels which means that I
cannot scan an A4 sheet of paper at 600 dpi (my printer resolution).
I have to scan at 300 dpi and increase the size by a factor of two
to do a "photocopy."

Secondly the scanner program (GT Look) does not always work
properly. I have about four different versions and if I change the
configuration of the Hades I often have to change GT Look. (Example
of change of configuration would be installing an updated version of
ExtenDos Gold as I did recently.)

Thirdly there has been a hardware problem with DMA and SCSI access
to the CDR. This has been fixed by Roger Burrows rewriting his
CD.BOS to cope with it.

Fourthly I cannot get it to accept a resolution of 1280 by 1024 in
monochrome - I know this may not be the Hades itself.

|Actually the Hades is pretty stable as it is. It really depends on what OS
|you are running. I have found Geneva to be the most stable, but I still use
|Magic most often.

Single user TOS. I cannot imagine that adding another layer will
improve it but I may be wrong. It certainly is much faster and more
enjoyable than my previous Ataris though the picture quality is not
as good as the TT High.

Well you can make/customise your own os by burning an eprom:)

256 EPROM's (6 x chips sets) are OK for STF/M/FM but not the STE series
as these use a large (2 set EPROM)!

Actually, it is rather common to find SUN Sparcstations and DECstations, once high-end RISC workstations costing dozens of times as much as Ataris, selling for prices between 10 and 20 US dollars. It's quite like Alice in Wonderland, everything seems upside down, right?

I would of prefered you replied to the original post that
mentioned your name. Wasn't me that made the first comparison
and I only refered to you in regards to demand, not pre-orders.
Anyway, regardless I will NOT commit. If someone sees that
as negative... well I can't help that and if you look at past
projects dropped why should I bother. It's questionable
if the one project released is even worth getting, and lets not
even get into that, but it just adds to my being very skeptical.

I feel my concerns are valid regardless.
I'll stop posting to this thread so it will appear more positive.

OOPPSS sorry about that and thanks for pointing it out.

I do agree that the price is a decent price for a 64mhz upgrade for the TT. I would like to know how well its going to work. All the specs sound great but, I need to see it before I lay out $150 for something that may not work very well.

Don

Hi Steve

I guess I am trying to understand what you mean by "format". For example: What is SAVED when you save an ARR file from cubase? These would include things like stuff in the Inspect window,patch changes, and sysex material you have on a track. Then you could taker several ARR files and put them together to form a .ALL file or rayher a song which contains many arrangemets.

Or are you talking about if you bring a file into TXT editor: what is there?

HMMMMMM...perhaps if you tell us WHY? Why do you need a "format" on ARR. then I can try to understand what you want.

Tim (thinking too much!)

I would like to invite anyone of you to the Atari-midi mailing list.

>ARR. then I can try to understand what you want.

What I'm after is the format the file is saved in: the header of the file and where/what the segments in the file are.

Very much like an executable program file has to be in a certain format for it to be run; the header which contains all the info for the data, bbs section etc..

I am trying to recover a disk that has nothing but .arr files on. It looks as if the .arr files have header or pointers for the various sections of the file; much like tracker mods etc.

If I can find the start of the file, I want to be able to work out the length (or be very close to it). I will then be able to try and suss out where the other bits of the file has gone, hopefully.

So in a nutshell I am after the header info that tells me where the relevant sections are leading to the total length of the file!

As far I a can remember, there was an accelerator board for the TT called a Catamaran, and it worked well for some people, and was a disaster for others. There was nothing wrong with the Catamaran. There was nothing wrong with the TTs it did not work with. Its just that some MMU chips did not work that fast, and nobody seemed to find that out until it was too late. For one person, Motorola found a MMU chip that had been tested at a higher speed, and that made the Catamaran work.

I had a Catamaran, it did not work, and I hereby apologize for a lot of nasty thoughts about Cyrex. I would have had fewer of them if I had known about that MMU chip, or if Cyrex had known about that MMU chip.

Far as I know, in accelerator boards, you pay your money and you take your chances, and maybe get out your oscilloscope and try to see what is not working fast enough. Easy it is not.

Don,
Same here.. I want to know it works, before I'd buy one. The
shipping to the USA will bring the cost to the $200 range. I love my
TT.. but it's just too slow for me now.

Hi steve

Looks more complicated then I thought. So have you have tried loading these into Cubase, and they do not load? Or are you somehow trying to convert them to midi files? If you want to zip them to me at tconrardy@hotmail.com I can bring them into Cubase and convert them. (which is he only way to convert a Cubase arr into a midi file) I did try taking an ARR file into a TXT editor to see what it looked like. Just code to me. I am not a programmer. perhaps you need a programmer. however, if the above is true, feel free to send me the files and i can convert it. If you have a PC, you can get GEMEXPLORER to read the files onto your PC HD.

Hope this helps a little

Tim

>Or did Atari still own TOS when it was swallowed by Hasbro? (Meaning
>Hasbro will now own TOS)

Interesting thought. When companies like TUS sell TOS 2.06 upgrades
where do they get the TOS image from. Do they have to pay for each
one to someone?

My TOS 2.06 upgrade came from TUS (this TUS/ TOS is getting confusing!)
it looked like standard EEPROMS, as if they're programmed on the spot,
as to say. They didn't have a single ATARI mark on them at all. Also
the TUS upgrade was different as it had 1.62 *and* 2.06 in one.

Surely coping TOS, is coping GEM, and AFAIK GEM/Digital Research are
still going. That would be like pirate software.

What the hell would Hasbro want with TOS as well!!??

>GEM has now been "open sourced", and a number of programmers are working

I heard about this in AC. Might check out some sites about it.

It is incorporated into the new ISO-8859-7 (?) character set, which I think
Martin-Eric has been using some times around here. In old character sets, it
is set to replace the € sign, IIRC. It's present on alt.gr+E on newish PC
keyobards, too.

As a matter of fact, at least according to Swedish law, copying amongst close
friends and relatives is not an illegal practice.

Hiya

No! what I am trying to do is recover files from a disk that has gone wrong. There are 2 files on the disk, one of which is quite simple as I know the length and start of the file. The other, on the other hand, I don't know the length OR start cluster/sector.

What I need to do is track down the header, start of the file, and try and suss the length out from the header (hopefully). I have already found the end.

I would presume the first few bytes of the file will give info on how long each segment is, whether it be the 1st track, 2nd track or layout, or an offset to the next segment.

There MUST be some documentation, or someone that knows, somewhere!

****
Hi

Saw your posting on csas regarding sending money to Dan Ackerman...

If you and a few others get together and want to send some money for him to
me, then I will gladly write a USD cheque out to him for that amount.

Please let me know and make an announcement on my behalf on csas... It
would also be nice for people to be given a deadline for when the money
should be received by me so that I can pick a day to send out the cheque.

Regards
Denesh

|
|: > Hmm, $70? Then why doesn't he just make a batch? Mario Becroft has made
|: > more expensive hardware than this for the TT without pre-orders.
|
|: You hit the nail right on the head. In fact 100 committed sales
|: is probably no risk at all for Roudolphe, so you have to wonder
|: where the lack of faith really sits. Mario can't get some of the
|: stuff done fast enough to meet demand.
|
|I would like to make a few comments on this.
|
|There IS demand for the products, and if I got them done faster I would be
|selling them; but once my VMEbus graphics card, for example, is done, I
|will be lucky to sell 20 units. It is nice to think that you are
|supporting the Atari market, but the fact is that for this to be viable
|commercially I would have to sell *at least* 10 times that amount.

Perhaps this tends to support my argument that what is required is a
new TOS and 68060 based motherboard. Simple, fast and not requiring
to be adapted to something else (Falcon, TT etc). The prices being
quoted for the Milan and for the proposed CT60 are way below what
the Hades cost.

| . . . .
|The argument that you cannot commit to buying the product without seeing
|it is understandable, but Rodolphe is in the same position. Just as you
|cannot commit to buying it without seeing, Rodolphe cannot commit to
|producing it without buyers. And I can assure you Rodolphe's commitment in
|producing the unit is much more than yours in buying it; while you are
|committed to spending $150, his committment will amount to thousands, not
|to mention his time.
|
|And if you think about it, this problem can be avoided easily enough.
|Rodolphe must simply quote some firm specifications as to the price and
|performance of the card, and allow anyone who wishes to commit to buying
|it on the basis that it meets or exceeds those specifications. This way
|you are obliged to buy it if it works as advertised, while Rodolphe is
|obliged to make it work as advertised. If you cannot see the product
|working as advertised, you are under no obligation.

All sound common sense but people will be left with the fear that they will send off good money for something that they cannot get to work.

: projects dropped why should I bother. It's questionable
: if the one project released is even worth getting, and lets not
: even get into that, but it just adds to my being very skeptical.

: I feel my concerns are valid regardless.

Lonny,

I did not intend to suggest that your concerns were invalid.

I quoted your message because I thought you mentioned the figure of 100 sales. If you reread my article I think you will see that the quoting was correct, and the original message was attributed to Jo Even Skarstein (whom I have nothing against either). If I really did make a mistake, I apologise.

In any case, my message was not supposed to be personal; I was merely commenting on the views I have seen expressed by several people in this thread. My comments represent my own opinion and I do not expect anyone to agree with me.

I actually agree that Rodolphe Czuba does not appear to be handling this business well at all, and having read some of his emails that he has sent at various times I can certainly understand that some people have been very put off. Well that is their business, and I don't blame them. But this was not the subject of my article.

The points I was trying to get across were:
1. contrary to popular believe, the Atari market is not commercially viable (much as I wish it was);
2. I believe it is unreasonable to expect anyone to do work that is not commercially viable;
3. there is a way, which was described, which I believe would accomodate the concerns put forward by both parties.

I do in fact see where you and others are coming from, but it is my opinion that you may be missing the important facts which I have outlined above, and detailed in my previous article.

An interesting idea...

Has anyone made any upgrades to the Falcon TOS 4.04?

I'd like to see a upgraded version of the TOS 4.04. I would have thought that this should have already been done by now.

And, is there any burners that will work on Atari Computers that will allow TOS 4.04 type chips to be made???

If not, what is the bare essentials computer and hardware/software wise needed to produce TOS 4.04 type chips???

I wouldn't mind having the ability to tinker around with a personal custom version of TOS 4.04 on one of my Falcons.

Any info on this is much appreciated.

Hey Ben,

I have the Mega your looking for.
However, I am asking more than $100.00 for it.

But, I am opened to trades for Atari hardware and software that I
don't have.

If interesed, e-mail me a list of Atari Items you have for trade.

Atari Falcon 030 modified with a CenTurbo II B version.
Atari Falcon 030 with factory CPU and FPU, TT Touch keyboard Upgrade.
Teac CDR, 2 Pioneer 6 CD Rom Changers, Misc CD Rom drives & hard drives.
Falcon Hardware: Expose' Color Video Digitiser & Apex Media v2.41,
3 VideoMaster Falcon Cartridges & Splitters, ColorBurst Hand Scanner,
Blowup Hard I (Internal), ScreenBlaster II (external), FalconSpeed,
Cubase Audio Clock (DSP port), Nemesis 25/50 (not installed) and etc.
Atari Mega STE TOS 2.06 internal HD with Vortex ATonce 386SX.
Atari Mega ST4 TOS 1.04 stock. Atari 1040 STE TOS 1.62 4megs stock.
ST/STE Hardware: VideoMaster ST/STE/Falcon cart, VIDI ST & Splitter,
GoldenImage HandScanner, Spectre GCR, SuperCharger, and etc.

3095. Grandad's Quest ST question

Newsgroup: comp.sys.atari.st
Date: 2000-09-23 00:00:00 UTC
From: Satcom2 <svenhard@primenet.com>
Message-ID: <8qjcr3op1@nnrp1.phx.gblx.net>
Source record: 57188

Does anyone have the unlock code for this game? I registered it years back, I think the authors name was Ian Scott. I can not find him anymore, and I did massive websearching and e-mailing trying to contact him. I even sent him snail mail, but got no response at all.

If someone could e-mail me the code I would appreciate it. I think it is just a single 4 or 6 digit number, which is the same code for every copy of the locked shareware version.

I wrote it down on a backed up disk with the game copied on it that I let a friend borrow, and he lost it.

I want to play this through again! It is fun and I miss it! Thanks. -Satcom2

3096. 4 Meg 16mhz STe for classic games trade!

I am ready to let go of my favorite Atari computer, to support my game collecting habit.

It has an AdSpeed accelerator installed. TOS 2.06, and 4 megs of memory. Nice clean machine, not yellowed at all. Every rare now and then you have to re-seat (push down on) the processor/accelerator chip (this is fairly normal since the accelerator sets in the main chip socket and has a big board on top, making it easier for the chip to "creep" in the socket), or else you get a black screen, but usually only after a long time of inactivity (ie being in the closet for a year). It is a very stable setup other than that one infrequent, and easily remedied problem. (I used to LOVE web browsing with this back in 1996! Fast and NO Windows crashing on you like Micro***t)). I will throw in a mouse and an Atari joystick.

All I want is 20 points worth of stuff from my want list, if you cant quite get to 20 just let me know what you have for me and we'll work out a deal, but you must have at least 2 items I need please or do not bother e-mailing. Thank you. -Satcom2

This sounds similar to the problem that I had with an earlier
version of the sting.stx module. It wouldn't connect to my ISP but an
earlier version worked. I don't recall the version numbers off-hand, but
it was before Ron was handling STing.

Source record: 57191

You can download several good emulators from the Little Green Desktop site. The URL is:

http://lgd.fatal-design.com/

I recommend WinSTon. Please note that some of the emulators might require you to have a TOS ROM image. The site above also has them but you should only download the ROM images if you actually have an actual TOS as part of your Atari ST. The latest version of WinSTon (version 0.4) has a version of TOS built in.

Hope that helps.

: You hit the nail right on the head. In fact 100 committed sales
: is probably no risk at all for Roudolphe, so you have to wonder
: where the lack of faith really sits. Mario can't get some of the
: stuff done fast enough to meet demand.

I would like to make a few comments on this.

None of my Atari products really makes a profit. If I was to account for the time I spend on designing these I would be working for x dollars/hour; I have not calculated it, but x would be extremely small (maybe about 5, maybe less, and that is not accounting for business overheads).

There IS demand for the products, and if I got them done faster I would be selling them; but once my VMEbus graphics card, for example, is done, I will be lucky to sell 20 units. It is nice to think that you are supporting the Atari market, but the fact is that for this to be viable commercially I would have to sell *at least* 10 times that amount.

I am continuing to work on these projects only because it is interesting, it is good experience, and most importantly, I have been fortunate enough to have time to work on unprofitable projects. This situation is changing, which is why my last two products (VMEbus graphics/ethernet and SCSI-ethernet adapter) are taking such a long time to be completed.

So to get back to the topic of this thread. Saying that because I can do it, Rodolphe Czuba should be able to do it, is invalid since what I am doing is not commercial.

It is pleasant, perhaps, to phantasize about 100 sales of the product, but from my experience in the current Atari market this figure is totally unrealistic. (Note the 70 USD figure was erroneous; it is really advertised at 150 euros.) It is easy to talk, but what Rodolphe needs in order to make this a viable proposition is sales, not words. And unless he is stupid he will realise that a figure of 100 units sales is unlikely to eventuate. Therefore the only realistic option he has is to ask for a number of people to commit to buying the device, and proceed if there are enough. Even this is risky because someone who was "committed" could easily change his mind.

The argument that you cannot commit to buying the product without seeing it is understandable, but Rodolphe is in the same position. Just as you

cannot commit to buying it without seeing, Rodolphe cannot commit to producing it without buyers. And I can assure you Rodolphe's commitment in producing the unit is much more than yours in buying it; while you are committed to spending $150, his committment will amount to thousands, not to mention his time.

And if you think about it, this problem can be avoided easily enough. Rodolphe must simply quote some firm specifications as to the price and performance of the card, and allow anyone who wishes to commit to buying it on the basis that it meets or exceeds those specifications. This way you are obliged to buy it if it works as advertised, while Rodolphe is obliged to make it work as advertised. If you cannot see the product working as advertised, you are under no obligation.

In any case, Rodolphe is under no obligation to build products for the Atari market, at a loss or otherwise, and I do not see how anybody can have any basis for complaint. If anything, we should all be grateful that he even considers making a product for this dead platform. No offence to the people who disagree, but I think they need to stop dreaming and come back to the real world.

Perhaps Rodolphe is not as good as he could be at communicating, but this does not influence any of the issues that I have discussed.

>
> Here's the info from the chip...
>
> MC68882FN16A

Its a 68882 FPU designed for 16MHz clock speed.

I have an 'MC68882FN20A' in my Falcon, which is designed
to run at 20MHz, but actually runs at the standard 16MHz
that the Falcon uses as its crystal for the FPU socket.

The quoted clock speed on the chip therefore isn't gospel,
and can be under or over-clocked...(over preferably, you'd
be silly wanting to run your hardware slower than it is
designed to run! :)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

HI

Additive synthisis is different then FM as additive is basically SINE waves that are mixed together with different frequencies as well as Volume levels and different envelopes to create a sound. An Organ is a type of Additive synthisis. Kawai and others have excellent additive synthisizers. FM can do Additive for eaxample on a DX7, if you select algorithm 31 or 32, it is basically 6 sine waves that you can minipulate. Wendy Carlos was a pioneer in additive synthisis and had several unique additive synths. She prefered them over the Moogs!

With this program, it turns your sampler basically into an additive synth, or more specifically, THE FALCON!!

there is a lot more on additive synthisis, just do a word search on the net...GOOOGLE it!

Who actually owns TOS?

I can recall that Atari sold Milan Computer some rights to TOS - were they ownership or customisation/modification rights?

Or did Atari still own TOS when it was swallowed by Hasbro? (Meaning Hasbro will now own TOS)

GEM has now been "open sourced", and a number of programmers are working on GEM version 5 for the PC (with a very 3D look to it - and it still runs within the "640k ought to be enough" memory space of a 1980's PC XT)

A NEW Atari-Midi application is now available at my site

Harry Koopmans MIDI JOY. Inspired by Laurie Spiegels Music Mouse this
app has to be seen and HEARD to be believed. There is also an HTML
format of the manual, at least it is started (translated from the dutch)

Check it out! Great graphics on this one!

Hi Daniel,

Not so easy to download!!
Get to above URL, then to productions, then where???

CAB 2.8

Lovely pages at first, then all that Swedish!!!

Bob King.

Hi Bob,

FlexTrax is listed on the top of the productions page. Just click on the
download button to the right if you want a copy. Let me know if it
doesn't work, and I'll send you a copy of FlexTrax by email!

The pages are entirely in English, no Swedish, so I'm afraid I don't
understand what you mean by "than all that Swedish".

Take care,
Daniel

So....

Before we all go off on one about software piracy and the like - a subject which has been gone over a thousand times already - I'd just like to remind anyone who's even vaguely interested in owning an Atari computer that I still have a good condition S20 STE for sale. And for just 25 ukp as well or 50 if you want the (needs attention) mono monitor as well.

Has anyone any argument about this? If it makes certain people happy, I will be happy to only copy free and shareware stuff and not stuff that could be deemed 'commercial' software. I wouldn't like to deny anyone a hot meal would I?

Indeed there is certainly no problem whatsoever to create TOS/DOS
compatible partitions on the Hades. I'm using this option very often.

3125. Lttile help with a CDROM please,,,

Newsgroup: comp.sys.atari.st
Date: 2000-09-24 00:00:00 UTC
From: jba4@po.cwru.edu
Message-ID: <39ce2946.3165435@news.cwru.edu>
Source record: 57112

Hey everyone! I just bought a 4x CD ROM for my TT030. It seems to be working perfectly. Now I have some questions.

First off, I'm running SPIN! v0.34 under MINT with AES4.1. The metados driver is loaded first, tyhe the SPIN.XFS is loaded by Mint and everyone is happy. Now I've noticed that if I ever press eject on the CD-ROM and put in a new disc and close the draw, it cannot be read. Now if I use CDPLAYER to eject the drive an dput a new disc in, everything is fine. So does the OS need to eject the disc, or does the SPIN/Metados combo just not work well.

Ok, second, I don't wuite understand the deal with audio on the CD player. Should I expect to hear the sound thru the TT's speaker? 'Cause I definitely do not. The more I thought abnout it, the more it made sense. Perhaps I can only attach speakers to the CD drive's actual audio output. So, is that the only place I'm going to hear sound? Just wondering.

So that's all my questions! Thanks for any help that anyone can give! I really appreciate it!

It sounds like the problem could be with your Syquest system itself, i'd be checking the
power supply first myself.

You will need to use headphones or some external speakers attached
directly to the CD player. The SCSI cable will not carry audio
signals. ;-)

Sept. 24, 2000
I'm getting rid of my ST stuff. If nobody wants it in about
two weeks, it goes out to trash.
I don't want to ship it. It is too heavy and probably I
wouldn't get enough to cover my costs and trouble.
If anyone wants to pick the stuff up, they're welcome to it.
I have a 1 meg 520 ST, a stock 520 ST, both work. Two dbl.
sided floppy drives, one doesn't work. Some single sided
drives that I think work. Two SC1224 monitors, both work.
Some software and books. All power supplies and cables.
One ST mouse, it works. If you want ALL this stuff, and can
make a time to pick it up, it's yours. I'm in the Cleveland,
Ohio area.

Hi Martin (and Daniel),

have repeated my try to download the file. When I get past the intro page, plain
'NEWBEAT' graphic link, into main.html (framed), then into productions.html, the
supposed link under 'Download!' doesn't work for me, I also use CAB 2.8.
Code is:

<FORM NAME="Download" METHOD="post" ACTION="http://cgi.swipnet.se/apps/formmail">
<INPUT TYPE="hidden" NAME="_thankyou" VALUE="productions/FTRAX09.ZIP">
<INPUT TYPE="hidden" NAME="_subject" VALUE="Download: FlexTrax v0.9">
<INPUT TYPE="submit" VALUE =" Download! " onMouseOver="window.status='Download FlexTrax
v0.9'" onMouseOut="window.status=''">
</FORM>

I finish up at http://cgi.swipnet.se/invalidreferer.html

as I said all Swedish!!!
```

Don't get it, either why you succeed and not me or the FTRAX09.ZIP file.
Daniel, please e-mail as promised.

Bob king

You could also attach an amplifier to the CD's audio output pins (4 pins at
the left edge) these are where sound cards take their input from, at least that's
where I connected an amplifier for an early CD reader that did not have a front
jack socket. Then fed straight into standard pair of stereo mini speakers.

Bob King.

that sounds very unusual - when I had my first CD-ROM unit for my STe and later my Falcon, I never had this sort of problem, neither under ExtenDOS or SPIN! Then again I never used MiNT, so I'm not sure that it's related to that. Maybe it has something to do with modifying the configuration file.

I do remember that Thing has an "eject media" function built into it that can be called up with a keyboard shortcut.

unless you can find a cable for the sound output on the back of the unit that would allow it to hook up to a pair of speakers, the only other way would be to hook it up to a stereo system via the headphone jack, using a 1/8" stereo to two RCA jack cable. This is what I've done for years to play my audio CDs, with excellent results.

We're lucky in that just about any brand SCSI CD-ROM drive will work with an Atari - in my recent Mac pursuits I've discovered that only certain drives from certain manufacturers will work out of the box with Macs (Apple-branded and Sony). Anything else like my Toshiba 40X won't work unless I invest in a separate driver program that runs mucho dollars (much more than ExtenDOS or the SPIN! driver), Toshiba has told me that they've stopped development of Mac drivers - or if I hack the CD-ROM driver file that comes with the Mac OS using ResEdit, which works up to a certain point.

Thank goodness for guys like Roger Burrows :)

3137. 1040STf to Scart mod?

Newsgroup: comp.sys.atari.st
Date: 2000-09-24 00:00:00 UTC
From: Mark Painter <markpainter@ntlworld.com>

Source record: 57124

Hi All

Having just been given a 1040STf after being out of the scene for years, I am trying to remember the mod that has to be done to get the monitor output to work on a scart (Peritel) cable to a TV.

I vaguely remember it needing a couple of diodes from the horizontal and vertical sync to somewhere in the cable.

Sorry if this a FAQ, but I have had a look at loads of ST sites and failed to unearth it.

Anyone remember?

Regards

Mark Painter

Source record: 57126

I set up NVDI on my Falcon and selected prx-->prg in auto. Now the Falcon stops dead in mid-boot with 'can't find monochrome screen driver' STOP...

Now I can't boot the Falcon to get to the auto folder so I can disable NVDI until I get everything working correctly. IS there a bypass to boot from a:\ insteead? It keeps defaulting to the hd instead and then locks up.

Thanks...

3140. Microdeal or Psygnosis Websites?

Newsgroup: comp.sys.atari.st
Date: 2000-09-24 00:00:00 UTC
From: Byron Followell <byronfollowell@hotmail.com>
Message-ID: <8qmd60fjp1@nntp9.atl.mindspring.net>
Source record: 57127

As I fondly recall my old Atari ST days the games I think of most are the ones from Microdeal (Micrograph) and Psygnosis. I was always impressed with the quality of the games that came from these two publishers. Does anyone know if there are any tribute type websites related to either of these two companies and their software or of anywhere I might be able to obtain a full listing of the titles they published for the Atari ST line? Any information would be greatly appreciated. TIA.

Sincerely,
- Byron Followell

3143. FLEXTRAX v0.9 released!

Newsgroup: comp.sys.atari.st
Date: 2000-09-24 01:19:07 UTC
From: Daniel Hedberg <nospam@thankyou.com>
Message-ID: <fEcz5.361$jk1.18641@newsc.telia.net>
Source record: 57193

Version 0.9 of FlexTrax, the soundtracker for Atari Falcon030 compatible computers is now released!

Version 0.9 has support for both the AVR and WAV sample formats and the sample editor has been greatly improved. FlexTrax supports the standard MOD file format (up to eight channels) for compatibility reasons but also features a new enhanced module format FLX. The FLX format is an extended version of the standard MOD file format with support for real-time sound effects like reverb and delay. The replay routine used in FlexTrax was first developed for our platform game "Willie's Adventures". Both VGA and RGB monitors are supported.

Get it from http://home.swipnet.se/newbeat/

All the best,
Daniel Hedberg

> Has anyone made any upgrades to the Falcon TOS 4.04?

Yes.

Needs TOS 4.04 image from original TOS Chip.
Original TOS 4.04 was sell by C-LAB, Woller any maybee by BEST

> I'd like to see a upgraded version of the TOS 4.04. I would have thought that
> this should have already been done by now.

Needs JuniorPrommer hardware and the very rare PLCC expansion.
Pinatubo-Software read and write the chips.

Without chip you have to read out the TOS 4.04 on a machine with 4.04
Image is burned into an OPT ROM for -> 60 DM
PLLC eprom in this form are very rare and expensiv too.

Itï¿½s nearly cheaper to take an ready to use 4.04 from somewhere.

> And, is there any burners that will work on Atari Computers that will
> allow TOS 4.04 type chips to be made???

JuniorPrommer. PLCC Expansion. Off, nobody sell them.

> If not, what is the bare essentials computer and hardware/software wise
> needed to produce TOS 4.04 type chips???

Horrable expensiv eprom burners that can handle plcc chips
-> 2000 DM

> I wouldn't mind having the ability to tinker around with a personal custom
> version of TOS 4.04 on one of my Falcons.

Image makes no sense if you doasnï¿½t have the chance to burn it.

>Has anyone made any upgrades to the Falcon TOS 4.04?

Yes. The Milan TOS is based on the Falcon TOS sources and is currently at
version 4.08, with both bug fixes and modifications to support the Milan
hardware.

TOS 4.0x can be compiled for other machines (I had it running on my TT
during development, when the Milan hardware was not yet ready), but it would
need some work to get the current sources to work completely on the TT or
other non-Milan machines.

>And, is there any burners that will work on Atari Computers that will
>allow TOS 4.04 type chips to be made???

Yes - the Maxon "Juniorprommer", along with harun Scheutzow's 16-bit adapter
and my Pinatubo software, can be used to burn 27C4096 EPROMs.

>If not, what is the bare essentials computer and hardware/software wise
>needed to produce TOS 4.04 type chips???

Any decent universal EPROM programmer that can handle 16-bit EPROMs, along
with a PLCC adapter.

If you want good GEM emulation, then you can use either Gemulator 2000, TOSBox or STEmulator. If you want to play ST games, then use WinSTon v0.5 as it is quite simply the best ST games emulator.

Unfortunately, development of WinSTon stopped because of some little toe-rag hacking into the authors PC to steal the source code, amonst other things.

And look out for SainT in December if you like ST demos :)

>
>ken

Hi

I'm a little lost at trying to understand your problem:(

Diamond Edge will not be able to help you if the disk you are trying to
examine IS NOT formatted to start with.

If the disk isn't formatted you WILL get the message that you mentioned.

What you want to do is format the disk, which is easier using the format
routines from the desktop.

Get to the lovely green desktop thing, stick the disk into drive A.
Click on the drive A icon to select it. Then go to the FILE selection on
the menu bar and select FORMAT FLOPPY DISK from that menu.

When you get to that, make sure that DRIVE A is the selected drive,
click on double sided (single sided if you have a single sided drive).

Click on OK and the drive should be formatted for you, this takes a few
minutes so please wait until you are displayed with the amount of space
that's free.

If you're loading a program in from floppy, you haven't mentioned
whether Diamond Edge was from hard drive or floppy so I presumed floppy,
then there shouldn't be much wrong with the drive.

Now if you have done the above and are using HIGH DENSITY (HD, 1.44meg) disks, then that will be why you are having problems! Only use DOUBLE DENSITY (DD, 720k) disks on a double density (standard ST) drive.

>him. And you can bet I got somewhat unfriendly too in return ;-)

And remember: the more skilled you are the less friendly you have to
be to keep your customers!

I am much happier dealing with a unfriendly and competent person. The
nice and friendly types too often tend to cover up there
incompetence...

Actually I bought my first Mega2 from a very unfriendly dealer who
later gave excellent service installing the blitter etc.

Hi

I'm going to write a page on my web site that describes how to injet
the audio into the motherboard.

Done this on my computer and works very well. The difference between
mine and a few others I've seen is that mine is placed just before
the LM1772 tone control found in STEs so you can control the volume,
bass, treble and balance.

So it'll only work for STEs, but not sure about Falcon/TT. I assuming
the TT has a LM1772, what about the Falcon?

Try holding down Alt or Cntrl while it is booting. You might then
need to install C before opening it.

Hi,
There is a program, SNDTHRU (if I remember the name correctly), which
sends everything present at the audio input directly to the audio output
on the Falcon - so you don't actually need a hardware modification
there...

: >not work that fast, and nobody seemed to find that out until it was too
: >late. For one person, Motorola found a MMU chip that had been tested at a
: >higher speed, and that made the Catamaran work.

: Huh? what MMU are you talking about?

: The TT uses a 68030 CPU, where the MMU is integrated into the CPU (the
: memory controller is external, but is not made by Motorola).

: All the cattamaran did was overclock the TT CPU to IIRC 50MHz. This is a
: problem in two ways: first, the CPUs used in the TT are not spec'd for 50MHz
: operation (which is not Motorola's fault at all), and second, the TT's
: internal timing is quite hairy - tiny modifications, even buffering the main
: clock, may lead to an instable system or one not running at all.

OK, MCU. Yes, it is marked as an Atari part, and somebody made it. The
rest is a repetition of a posting in this group as to how he got his Catamaran
working. Guess he and the Motorola rep in his part of probably Germany were
wrong.

Can you be more specific than "timing issues"?

: Do not meddle in the affairs of dragons,
: for you are crunchy and taste good with ketchup.

Source record: 57058

FamilyNet HQ: Telnet:\\www.family-bbs.net

In the realm of the Newton MessagePad I am currently working on making various apps to give the Newton more of an Atari touch. And of course I am putting these on my Atari/Newton Connection site when I'm done.

Having established various connection programs for those two computers to talk to each other, I am now working on MUSIC!

The Newton has a Modplayer. It works great but the Mod files need to be altered slightly to work with the player. I have a way now of doing this quickly (Thanks to the creator of the Modplayer and the creator of the Newton webbrowser), so now I need MODS!!!

So please, if you know of some good mods that are from Atari games, remakes of sounds from Atari games, etc, please let me know, and let me know where to find them. I'll convert them, and bring that Atari flair to the Newton platform!

Thanks in advance!

I thought it should work. But it doesn't. :-(

Do you suppose there is a difference in the way the carts are made, by brand? Of the ones I've tested the carts that do not want to work are Maxell, the ones that do are Iomega. I know this seems way out there for an answer, but I'm really guessing here. The other thing is the Iomega carts were all modified over 2 years ago, the Maxell's just within the last 3 weeks.

Ah, I know, it's the Millennium BUG!!!!!!!!! muahahahahahahahahaha!!!!!!

Hi Steve,

> I'm a little lost at trying to understand your problem:(
>
> Diamond Edge will not be able to help you if the disk you are trying to
> examine IS NOT formatted to start with.

The disk currently in the floppy was formatted to 720K
When I click on the floppy A or B icon, I get an error instead
of a window.

> If the disk isn't formatted you WILL get the message that you mentioned.

I tried disks that I previously formatted and got the same error.

> What you want to do is format the disk, which is easier using the format
> routines from the desktop.

I was in STScan. Just finished scanning a small document.
Went to save as a .IMG file. Error occurred.
Tried to format within STScan. Because I didn't want to loose the
document I just scanned in.
Disk would not format.

Then went to desktop. Tried to format. Same error.
Then used the format program under Diamond Back III utilites.
Same error.

> Get to the lovely green desktop thing, stick the disk into drive A.
> Click on the drive A icon to select it. Then go to the FILE selection on

> that's free.

Thanks, will try little green desktop, but I don't think it will
format.

> If you're loading a program in from floppy, you haven't mentioned
> whether Diamond Edge was from hard drive or floppy so I presumed floppy,
> then there shouldn't be much wrong with the drive.

Diamond Edge was from hard drive. I can't load anything from the floppy
right now.
I even tried bypassing my AHDI driver, by booting from a floppy.
(and holding down the ALT key while booting)
I get the two floopy icons A and B, but when I click on to them,
no window.

> Now if you have done the above and are using HIGH DENSITY (HD, 1.44meg)
> disks, then that will be why you are having problems! Only use DOUBLE

I have been using DD, 720k's.

It's possibly worth pointing out that this will work with a Falcon, so long as
the CDROM drive supports the transfer of audio data as data down the SCSI bus.

3170. problem accessing floppy

Newsgroup: comp.sys.atari.st
Date: 2000-09-25 00:00:00 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <39cf382d$0$56644$392904a7@news.execpc.com>
Source record: 57137

Hello,

I am having problems accessing floppy A or B:
The message reads: Data on the disk may be
damaged, or the disk is write protected.
There is nothing on the disk, and it is not write protected.
I cannot format a new one either.
When I view the disk structure of A through Diamond Edge,
I get an error message, DOS -14 boot sector not recognized.
(It won't access the drive)
All other hard drive partitions work fine.

Is my floppy drive bad, or did I mess something up internally?

Thanks and appreciate any input.

That's cos it's a Gemulator, not an Atari-ST emulator. It is the best
emulator if you want to run GEM programs. It's far more stable than
PaCifiST, echo and the late WinSTon.

>
>That's cos it's a Gemulator, not an Atari-ST emulator. It is the best
>emulator if you want to run GEM programs. It's far more stable than
>PaCifiST, echo and the late WinSTon.

Yes, but not one's preferred choice if one wants to use the ST for all
it's worth. I was one of those power users back in the day who used
it for practically everything under the sun -- gaming, programming,
word processing, telecommunications, graphics, music, etc. so a simple
GEM emulator doesn't cut it for me.

Plus, as I said, I have a thing about Derek. I've never counted him
among the great emulator authors. Hell, it took him 7 years to figure
out how to implement P/M graphics on his 8-bit emulator. And XFormer
STILL doesn't run Alternate Reality! :-) Okay, enough ranting...

The best emulator for the job, really. If all you want is GEM, go for
Gemulator. Otherwise, WinSTon 0.5 or PaCifiST 0.49 are your best bet.
Echo's up-and-coming, too, or STonX-DOS if you have a fast machine.

Huh? what MMU are you talking about?

The TT uses a 68030 CPU, where the MMU is integrated into the CPU (the
memory controller is external, but is not made by Motorola).

All the cattamaran did was overclock the TT CPU to IIRC 50MHz. This is a
problem in two ways: first, the CPUs used in the TT are not spec'd for 50MHz
operation (which is not Motorola's fault at all), and second, the TT's
internal timing is quite hairy - tiny modifications, even buffering the main
clock, may lead to an instable system or one not running at all.

The real way is to replace the TT's CPU with one which is spec'd at the
faster clock, however, this may still work flaky on some machines due to
timing issues on the TT board which vary from TT to TT.

>Hasbro will now own TOS)

Correct - at least, I am not aware that Atari sold their right for TOS to

>
>Interesting thought. When companies like TUS sell TOS 2.06 upgrades
>where do they get the TOS image from. Do they have to pay for each
>one to someone?

That depends on the contracts they made with Atari. I know multiple
companies in Germany that had a license to sell either one version (like
2.06) of TOS, or a general license.

>My TOS 2.06 upgrade came from TUS (this TUS/ TOS is getting confusing!)
>it looked like standard EEPROMS, as if they're programmed on the spot,
>as to say. They didn't have a single ATARI mark on them at all. Also
>the TUS upgrade was different as it had 1.62 *and* 2.06 in one.

If they have a license for both versions, that is OK. The look of the
labels will depend on who printed them - I am not aware that the contract
required some special look.

>Surely coping TOS, is coping GEM, and AFAIK GEM/Digital Research are
>still going. That would be like pirate software.

TOS is (C) Atari (or now Hasbro), who have licensed GEM from DRI a long time
ago, along with the right to give out sub-licenses.

>What the hell would Hasbro want with TOS as well!!??

I am not sure if the want it - however, it looks like they got it together
with all the rest.

WinSTon is the best for Windows right now. Unfortunately, Paul, the
Author, just stopped supporting it. The only other reasonable
alternative is PaCifiST, which is a DOS-based emulator, but also very
respectable. There are others out there in various stages of work,
but these two are the most compatible and the most complete, insofar
as they _are_ complete to any degree.

Both can be found at www.vintagegaming.com or www.classicgaming.com.
WinSTon still has a quasi-mirror page and message board at
http://winston.atari.org.

To respond to this message, please use the enclosed email address rather than your reply button. Dealer enquiries are welcome.

- Last Updated 09/24/00
- Sold items removed

I have a limited amount of brand new Atari Jaguar items for sale or trade (these are not refurbished units). These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25 - Only a couple left

** Atari Jaguar Accessories - New**
==========
- Team Tap (4 Player adapter) $20 - 2 units left
- Jaguar unit alone (No power supply, controller or accessories) $20
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $10
- RF Switch Box $5

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========

All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- An original Intellivision keyboard for the original Intellivision
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues 12 thru 20

That programme is smart. I used to have it with my ST but lost it somewhere. In a few weeks of getting on the net, I downloaded it. I think it was on the Umich archive site. The way I found it was go to Yahoo, then search for "ST speech".

I can send it to you if you're stuck.

Greg,

I have a few. I'll get them to you later.

You can find some Amiga mods here (yes, I know they are not ATARI mods,
but you can play them on the Atari).

http://wuarchive.wustl.edu/systems/amiga/aminet/mods/

Also check out:

http://leonard.oxg.free.fr/

He has several players for the YM file format files (used with the YM-2149
chip tone generator). There are some good YM files to be had. I don't know
if you can play them on the newton though....

l8r,
Chris

okay, i'll try that..
but is there any other proggie that does that? writing st disks?

i gotta say, i didn't have the time yet to get used to the atari
system.. i just bought an atari st 520 (damn 20 bucks!) and since i
only got one proggie (appart from the tos), i'd like much to be able
to download games from the internet for it

(can't even do copies, i don't have no hd, nor even a second floppy
disk drive)

thnx all

Hi all,

Call me a crusty old wrinkly, but sometimes I think we need a moderator on this NG (They are the bods. who filter off inapropriate subject matter aren't they?). All I did was draw attention to a new Milan II rumour and we get the (to my mind at least) pointless, childish and non-informative prattlings of Sinclap and co. These are all very well for the comp.sys.st advocate NG, but I thought this was a serious NG.

Bob King.

>it was before Ron was handling STing.

The problem seems to be solved with Ronalds V1.21 of SERIAL.STX; Ronald
says it involved 32-bit code in a segment that dealt with some watchdog-timer
routines that some ISP use. However, another problem seems to have
appeared, and I am not sure whether it is STinG or my ISP:

Can somebody who had a situation like above (i.e. serial.stx crashed
but earlier version worked), reproduce behaviour like this:

- when I am connected to ISP but doing nothing, ISP's watchdog-timer
routines contact my computer at regular intervals- I see it by blinking
modem send/receivelights, every 10 seconds here.
- when I am doing a longish file transfer, the ISP always disconnects me
after a fixed time period (exactly 1 minute here) after the last
send/receive "blink" that happened before I started file transfer.
This happens to me in Newsie and in Cab. It almost seems that my computer
is not able to answer the watchdog-timer checks while it is doing
file transfer.

I have asked a friend to check a situation like this with his PC on the
same ISP's node (still waiting for the result), but, meanwhile, it would
help if I knew that someone else had the same problem.

>(should be if untouched).

Also worth noting?:
On my TT I get the same behaviour if I boot with the SLM605 laser
turned off. Harddisk is still accessable, though. When I turn the
laser on (without rebooting!) suddenly drive A can be read again.

> >|cables should be ok. If it is the drive, can I pop one in from
> >|an old 1040stf?

Hello,

Well, this is what happened. I interchanged the 1040STf drive
with the Mega ST4. Same drive. Only difference.
The drive light on the 1040STf was slightly "shaved" so as to
I assume, to allow the top cover to fit snug.
Powered up. Clicked on Icon A: Same dang error:
Drive A: is not responding. Please check the disk drive or
insert a disk.
Then it dawned on me. Dah. All the boot disks I have been using
had gotten corrupted. So I freshly formatted on another computer
and "walla" it worked!
So, Diamond Edge was in fact, diagnosing correctly.
"Cannot recognize boot sector" or something of the sort.

It must be a double sided drive, cause that is what I formatted to.

Thanks for your help and suggesstions.

>sometimes in the non-Atari drives the data lead has to be inverted.

The power lines are pretty much standard, the schugart interface (the
data lead thing) won't do any damage if plugged in the wrong way.

All the odd pins are grounded so if plugged upside down the motor will
be constantly on, and the computer will not detect he drive.

The only problem may be if the STF drive is single sided and if the
other drive is double sided you aren't going to be able to access double
sided format disks!

Hi

I think it's safe to say that the drive has deceased! hang on a mo
though:))

Have you cleaned the drive heads, I know this may sound silly but I have
come across drives that suddenly pack up due to the heads getting dirty.

The heads are quite easy to do, remove the drive and it's metal cover,
using a cotton wool bud (those things you clean babies parts with) with
some cleaning agent (I use after shave as this is alcohol based)
carefully clean the heads.

You should notice the buds will get e little dingy. Use a dry clean bud
to make sure the head is dry.

CAUTION: don't have the bud dripping as the electronic components won't
like it very much.

I also like to leave the drive 10-15 mins to allow any solution that
I've missed to evaporate before use.

3208. Boot problems with Milan I

Newsgroup: comp.sys.atari.st
Date: 2000-09-26 00:00:00 UTC
From: rking@zetnet.co.uk
Message-ID: <39d077b2$0$8007@news.zetnet.co.uk>
Source record: 57082

Hi all,

Any help with following minor niggle.

Have Milan I, latest TOS 4.08 flashed. When I switch on HD whirs a bit, blank
screen. Have to press reset button to go further, 'beep', up comes blue Milan logo,
then white screen. until latest TOS was flashed, boot-up continued. Now remains
at blank white screen until I press a key, I think any key, keyboard is polled, Num Lock,
Caaps Lock and Scroll Lock lights flash and boot up recomences. Bit puzzling as
as computer must be aware of keyboard to react as above, but all (flashing lights etc)
indicate
that this is not so.

Not a major problem, just annoying. Grateful for any help.

Bob King.

In that case, it may be either the ST-RAM MCU or the TT-RAM MCU (which is
located on the TT-ram card and may be from Atari or a custom part of the
producer of the TT-ram card, like on the MagnumTT).

Anyway, as there were no datasheets or specified timings for atari custom
chips: if you overclock them and they stop working, that's your fault (or
the accelerator's), *not* the parts fault.

it's spelled "gall". Mebbe ya should go back to remedial
kindergarten? "Gull" 's a good description of Sincrap, who believes
everythin' Jobs spoon-feeds da lil' brat.

howcome it takes Apple SEVEN YEARS to develop a "brand new"
operatin' system - with features dat da penguin pushers dey've had fer
years - and den gouges Apple fans $29.95 for da "privilege" of usin'
unfinished software? (Please don't try sayin' "but dere's OSes 8-9.04" -
we ALL know that dey're th' equivalent of puttin' go-faster stripes on a
Yugo!). Sincrap is sleepin' in a glass house nekked again...

please, all yas Atari pushers note - Sincrap has a problem with
Motorola 680X0 processors. Usin' his way of thinkin', all Macs dat use
dose chips are trash an' only good for fish tanks an' boat anchors ....

da Milan (when it shows) is da equivalent of breyers Natural Vanilla,
compared ta da Mac, which is lookin' more an' more like da brick of
$1.99 cheapjack stuff made with artificial Vanilla dat's been sittin' in
da back of da freezer fer da last five years...

by da way, Sincrap, still playin' da troll ? Take dis craptrap of
yours ta advocacy where it belongs.

> sincrap!
> somewere in mn

probably still sharpenin' pencils.

Razor.

3212. FAQ on TOS burning?

Source record: 57086

Hello ST people,

Recently I bought an Atari 1040STF from Germany with german TOS dated with 1987 (1.02 I suppose?). Since I don't know German, and I really like English, I would be simply happy, if I will be able to replace this version of TOS with UK version 1.04 or 2.06. What kind of chips do I need, and is there any issues, which might arrive?

Actually, if someone could describe briefly all the process (some kind of Linux-like howto), I will be very happy!

Ah! One more thing... How much does cost an IDE HDD controller for AtariST? And who sells them nowdays?

Thank you in advance,
Adrian

This is the same mistake I made. This is because Atari called the
DRAM memory controller an MMU, which is not really what it should be
called.

I think it was you who got me straight on that matter.

It's an easy mistake to make, if you read the Atari Docs.

Being polite to "your" customers should not be a skill. It's common
sense. I say it ain't going to help your sales figures being rude.

>I am much happier dealing with a unfriendly and competent person. The
>nice and friendly types too often tend to cover up there

No there are a lot of genuine, nice people out there. I don't like
buying off unfriendly people as it gives the impression they don't give
a damm about you. When I sell someone something, I care about what
they're getting for the money.

Dear Atari programmers,

I purchased my Atari 1040 STF a week ago, and now I wish to port the disk magazine engine to this platform.

To do this job I need a decent C compiler (or cross-compiler like gcc, if no good native compilers are present). Could you give me any recomendations? Ofcouse I am not able to pay for commercial product, because the project is non-commercial.

Any recomendations are very welcome!

Best regards,
Adrian

Steve-

Thanks for the response, but you got me worried now. I've been concerned it was the device but had always heard good reports of their stability...

Yeah, my original inquiry was to comp.sys.atari.st.tech and the only response suggested the possibility of conflict between ICD software and HDDRIVER. Still looking for other possibilities but if it is likely the syquest's power supply, what can I do to resolve this? Is it difficult to replace? replacement difficult to find?

Hi Mark,

I have the installation instructions and the drivers. Mhz32.PRG switches the Mighty from the COMBEL clock to the 32Mhz master clock on the Falcon. Eagle Sonic probably works the same. Then there is FAFAXX.PRG, an application that loads alternate ram with Malloc.
There are 8-30 pin simm slots on the card.
If you get DoItF030, you will find some pics and a poorly worded document (not Roberts fault;) I wrote some time ago when I first connected my Nemesis to the Mighty. I think that I would want to review it for accuracy at this time, it was a long time ago.
Some of us have agreed that one of the speed limits on the Mighty and Afterburner are due to the Mach Chips used on the cards. If yours is just an 030 adapted to the expansion bus, I would think that you could run a Nemesis at 50Mhz no problem (I used the DSP clock wire).
The docs won't help a lot, and it states that the Eagle wires up differently than the Mighty. I think your best bet would be to find an AXIT fast ram card for the Falcon, and run it on top of the Eagle.
Mike

I played around with a Falcon type clock mod on a TT for a bit (Peter Greens CPU_ACCEL). I managed 40Mhz. SCSI wouldn't work after that, DMA and ICD Link worked fine. The machine had an AXIT TT RAM card installed. Anything above 40Mhz caused problems with the video, and I suspect that it was the ST RAM card causing the problem. The bus was speed up as well with the method I used. It was fast, but not worth the effort (in as much as the Nemesis isn't worth the effort considering the condition of your motherboard after an installation). The TT and service manual are long gone, so I couldn't answer any questions. From what I recall, I think a Nemesis could have been used and likely ran at 40Mhz, but you would still have SCSI problems.

Yes but I was talking about STEs, and AFAIK IDE drives don't support
audio down their bus. Only a few SCSI drives, as Derryck pointed out,
support Audio down a SCSI bus.

It would take a lot of load off the Falcon as well, as the audio data
is sent in digital form, so it would have to be decoded, right?
(I think you need an external 44.1Khz clock as well for correct
playback)

The toe-rag incident in question was after the fact. That just made
him decide to release the source code verbatim, rather than release a
version stripped of all DirectX and Windows GUI routines so that
wannabe developers wouldn't just rip off his source, change the name
and call it their own. Paul dropped everything because he works in
the games industry, and was sick at the discovery that someone had
come out with a Gameboy Advance emulator before the thing is even
released. (I presume he's working for a company developing GBA games)
He felt that the emu developer community had lost sight of the
original picture -- that emulators were originally designed to emulate
old, dead, classic systems that neither they, or the software for them
won't be forgotten, and not to pirate games for existing, commercially
viable systems. Pity, really, 'cos WinSTon was the best Windows
emulator out there, and was even marginally more compatible than
PaCifiST.

>

Would you have any ST Action demo disks?
I came home one day to find my ST and all associated software gone.
The only response from may parents was "We sold it"

I had one disk with a game called Myth on it. I posted a query on the Games BBS on LGD and someone said it was a demo but never released as a full game. I thik it was a french company but not sure.

You were this little devil guy with a pitchfork and you flew around killing ther beasties. Similar to R-type style side scroller.

It was released around the same time as Videokid, leander maybe a bit earlier - Heimdall, Baby Joe. Early nineties.

I would really like an image of this demo if you have it.

Thanks
Joel

If the drives are of the same type there should be no problem. The connectors are polarised - certainly the power leads are. I think sometimes in the non-Atari drives the data lead has to be inverted.

>where's the problem?

On my PC, makedisk can't format my floppy.
I use an another program to format floppy (fdformat, a dos program).
Then makedisk can write on floppy.

The Atari ST only read DD floppy, or HD floppy formatted in DD mode.

Some PC can't format HD floppy disk as DD floppy disk, you have to
close the hole for HD detection with tape before.
(It is possible to format a HD floppy disk in HD mode with only 10
sectors/track, but the Atari can't read that.)

Thierry

Yo! Jessica/Al, Hows that Atari thang going, keep those Atari's humming, that's what I say

Anyway re:Afan and a new Atari group

Mega idea, count me in... Another idea would be to split it into the geographical areas, only reason being is that if Atari dude(s) and lassies want to congregate and hold regular computer shows/ swap meets etc, similar as to what you guy's/gals's had in the US a few years ago

My interests in Atari are mainly several xe's (one with o-s contoller card, one with onmimon/ultimon and ultra spped o/s) 256k xl with o-s controller card, standard canabalized a800 (48k), 4meg 520ste, 2x 1050's (Lazer and archiver 1050) 1x indus gt (a8), I used to own a Jaguar (that Atari thang, not the car)

How about a main Atari search engine instead of this lycos/msn/yahoo shite/crap, and have an online shopping city combining video 61, toad (and the rest) and best electr., a products/ service request forum, electronics buy and sell, a news column, A brief insight into the atari personalities past, present anmd future (incl. Internet geeks/nerdies)... I'm sure you can adf your own... Because according to figures that Tramiels Atari once spouted out, there are supposed to be bet. 35-45million Atari fans out there, so I'm sure that there would be a 'need' for your ideas

Lastly what is it with this LYKEWYSE rubbish, it isn't bad enough that you americans/canadians (north americans) have corrupted and canabalized the greatest spoken language in the known world (English English) you now resort to spouting it on the internet... where do you stop, where does it end

Likewise

>Ofcouse I am not able to pay for commercial product, because the project is
>non-commercial.

GCC is available natively on the ST; however, I understand it demands a lot
of resources, so a 4MB machine with a good-size hard drive are requirements.

My preference is Sozobon, which is an ANSI-compliant compiler that isn't quite
so resource-hungry, and is also "free", available on most Atari FTP sites.
Watch this group for the FTP site list, a helpful Atarian posts it on a
regular basis.

Another possibility is Heat 'N' Serve C, which is a cut-down version of Sozobon
that can run from a couple of floppies. This is painful, but works.

Be aware that the compiler simply compiles. To create GEM resources (GUI
features), you will need a resource editor, of which there are several
also freely available. Other tools ("grep", "diff", etc.) are also available.

>processor with a limited amount of memory and speed. Not like today
>where they just add more memory and hard disk space and graphics cards
>blah blah blah.

Yep. That's one of the reasons I loved demos so much; they REALLY
showed off the machine's capability when it was put in the right set
of hands. It's also great fun going through the history of the demos
and seeing which ones came up with what new effects and who figured
out how to do what was previously thought impossible. Both the 8-bit
and the ST demos never ceased to amaze me with the progress the made
and with what they managed to make the machine in question do.

>You buy a computer these days and you cant play the games that come
>out a month later because you dont have enough memory!

Or a fast enough processor, or a good enough 3D card, or the most
recent DirectX, etc, etc. Yeah, it's pretty sad... no one is
interested in pushing the envelope anymore. These days the attitude
is, "Too slow? Upgrade your computer." Back then it was, "Too slow?
Let's optimize!" Optimization is a foriegn concept these days, and is
pretty much left up to the compiler to do -- and of course, compilers
can't optimize worth a damn. It's all about the coders and how well
they write their code in the first place. Plus, everything's done in
C++ these days -- for portability -- so too few people use assembler
to really squeeze out some solid speed. It's too complicated, it's
too slow to program in, yadda yadda... I've written in 80x86
assembler, and quite frankly, except for the serious pain in the ass
known as segmented addressing, I loved it!

Ah, the good ol' days... *sigh*

>with the method I used. It was fast, but not worth the effort (in as

You might even get it to work on a single machine - however, getting it to
run *stable* and without tweaking on *most* TTs seems to be impossible. You
need to tweak the timing for the special TT in case, and on many machines
the margins are very low - ie. it may be enough for the machine to stop
working when it gets warm/cold.

So this is something you can hack together and enjoy, but nothing which *I*
would sell as a product ;-)

Thanks for all the tips! I found everything I needed, I will have to try the
several
emulators I found. As far as I've seen, they do their job quite well :)

> And look out for SainT in December if you like ST demos :)

Nostalgia is back...no matter if you were using an atari, c64, sinclair or
whatever in
early days, it was just something different than today. Demos are a good
example
for that, since they show, what we could get out of these little
machines....

kind regards
Frank

Sorry to get back onto this subject but having tried all the ideas put forward back in July I'm still can't get Dialler.APP to run, let alone get online! :-((

Summary: First of all it locked up the system on bootup I got round that by replacing the .stx file with the old one. Then it locked up the system after boot up. I've now taken Sean's advice and put the entire STing/HSModem..etc setup onto a floppy and boot up with the hard drive switched off.

The problem is still that I get 2 bombs on boot up (yes I know Sean, it had stopped doing that but then it started again ...arrgh) but this seems to be ignored as boot up continues. When I go to use Dialler it starts loading up then 2 bombs and returns to the desktop.

All the programs are in the right order in the AUTO folder, the 4 .stx files are also in the correct order and all .inf files are pointing in the right directions.

I'm not using Magic, it's loading into TOS.

Only TCP, Resolve UDP and Serial .stx are being used. There are no blank spaces after entries in the STinG.CFG and Dial.SCR files. There's no Cache.DNS file yet and I'm running in 68020 mode - switching to 68000 made no difference. Am I the only one with/without Veloce who can't get it to work??

I've now run out of ideas but I'm sure it's something obvious that I'm overlooking - but what??

I'd like to get it sorted as I'm finding problems getting on to some erstwhile striaght forward sites plus I refuse to give in!

Anybody any more ideas what the problem(s) may be?

Hi Augeas,

There are a lot of different TIF types, different depths etc. Try PhotoLine. I think there is a demo some where, if you haven't got the actual program.

Dan,

I just installed STiK2 and I must say that I'm very impressed! I am currently running AES4.1 on top of FreeMiNT 1.15.5 and it works like a dream!

Ihave attempted to use STiNG and MiNTNet on my system before. STiNG just hated MultiTOS, especially the Dialer. And the configuration was very difficult and never quite worked. MiNTNet was impossible to configure. I never once got MiNTNet to do anything at all. I worked on it for weeks and it never once connected. Now I should state here that I have little network experience. I really don't know exactly what I'm doing.

But Stik2 I had runnning about 20 minutes after download. One single file controls the entire configuration. and it was simple to set up. Also, the dialer, Qdialer, is a phenomenal program. It's small and very useful and reports my IP address (my favorite feature). Furthermore, everything runs like a dream under MultiTOS!

I must recommend this program to everyone! STiK2 is a great and very stable program. So far, it has worked with NEWsie, aMail, aFTP, and CAB1.5 with the '030 and '000 binaries and overlays on my system! I'm defintely sticking with STiK2!

(Just wanted to say that this is my first post ever from my TT! I'm very excited!)

I suppose that FM synthesis is described as a "subtractive" or rather
"modulative" synthesis. Additive synthesis seems a tad difficult to implement
on a simple chip, though.

I asked this question sometime last year. I did a lot of searching.
The people here made a lot of helpful suggestions but I never did
find an Atari program that would load those TIFFs. That isn't to say
there aren't any, I just could find one. I concentrated my efforts
on free/shareware.

If you do come up with anything then please let me know.

Rich.

Are you booting without a diskette in the drive? If you do that, the Atari will sit there for a while, and happily spin it's empty drive. If you boot with a diskette in that drive (any non-bootable program disk), it should boot much faster. Or, at least thats what mine does....

Just my $0.02

Yep. I actually don't like doing this since (even with a CT2 equipped
Falcon), the result is a little jumpy. IIRC I could only get one track to
play and then had to return to the drive's directory to get the next one
started. I also think that you need to use a driver which presents the audio
track as WAV files to make this work.

I have to say that I also suspected something wrong with the DMA, but it looks like this problem's been resolved.

BTW, I assume that you know that you can quite easily modify your setup so that the controller box gets its 5V from a "wall wart" PSU, so you don't need to power up the laser? There's another mod around which involves some work on the PCB, neater, but my idea's much safer IMHO.

Cross-posted to: comp.sys.atari.8bit,rec.games.video.atari,comp.sys.atari.st

Hi Everyone,

Thinking seriously of creating a new user group for Atari. It will be called AFAN (Atari Friends and Neighbors). The mission of this group would to create an internet directory of worldwide Atari users to corrosopnd by e-mail, not nessecarily as a help group, but to create common discussion and bonds between those who share common interests and would like to network with others.

So, tell me, what does everyone think of this idea?

Lykewyse/Jessica S. Cornn

P.S: If you would like your name added to the list, please reply to this by e-mail with your name, e-mail address, Atari specifications (like what systems you use), and any ohter interests you would like to share. I will let you know if (and when) the group is created! Thanks!

ATENTION Southern Ontario Atari ST enthusiasts!

I know, I know, some people have been giving away their Atari ST equipment, and Im selling mine,..... so sue me! hahahaha

I have the following for sale:

1 Atari 1040STf (I think this may have expanded memory in it, but I have not opened it up to determine for sure) let's say it has 1 meg but maybe more....

1 Atari ST Colour Monitor
1 Atari ST Mono Monitor
1 Atari Megafile 20

A few programs, which Include PageStream, Microsoft Write, Sim City, and an Ultima game. (these are program packages, not pirate disks)

I'm asking $100 Canadian for the above, but there is a catch. You MUST pick it up in Hamilton Ontario. Please email me if interested and can pick up.

Thos were the days... Programmers strove to get the most out of a processor with a limited amount of memory and speed. Not like today where they just add more memory and hard disk space and graphics cards blah blah blah.

You buy a computer these days and you cant play the games that come out a month later because you dont have enough memory!

First I had a 'Falcon Wings' 14meg card. But that one's definitely
too slow. So since CentRAM was not available I also bought the
Wizztronics card. It works quite well and in case it should ever
quit working I have now a CentRAM card as a backup.

Hi,

Currently I'm using GCC 2.8.1 and would like to use GDB (and later
on GPROF) on my program. I found a GDB 1.8 somewhere. Can anybody
tell me if that's usable or which version I would need and where
I could find it (and maybe matching documentation).

Thanks
Gerhard

On Wed, 27 Sep 2000 22:31:45 -0700, "Puppy Dawg"
<swallow@intergate.bc.ca> drooled an embarassing wet spot in his lap
as he typed:

>>Actually, the demo disks I was referring to were megademos and the
>>like -- y'know, TCB, Lost Boys, Oxygene, etc. I do have a couple of
>>ST Action disks lying around though. I'll see if I can convert them
>>to disk images (assuming they aren't bit-rotten)
>
>
>Ooooo! Real Demo disks! Any chance of getting them posted (or emailed, or
>something, I dunno) in their original ST format? I'm tired of all these
>"Made for Emulator" demos. I mean, if I'm going to check out these demos, I
>want to see them the way they were ment to be seen! *sigh* i miss demos...
>the last demo disks I have are for my C64....
>
>Puppy Dawg
>

I'll see what I can do about dumping them to images. I used to
collect demos as a matter of obsession (one that has lost its appeal
-- or perhaps its entire point -- on the PC), so I've got loads of
'em. Perhaps not /all/, but certainly the best. :-) What I can't
dump I may be able to retrieve from umich or elsewhere, so with any
luck I'll be able to rebuild my demo library and use it on the PC. I
can't speak for how well they'll run under the emulators, but as
someone mentioned there's an ST emu on the way that's especially
geared for running demos. <crosses fingers>

What I'm able to dump I'll post to alt.binaries.comp.atari8bit as
they're dumped. They'll also be put on my FTP for those who can't
access that NG, or in the event that the posts don't propagate to some
news providers/servers.

Message-ID: <0003.39d3677c@fmlynet.org>
Source record: 56955

FamilyNet HQ: Telnet:\\www.family-bbs.net

Hey there, how's the week going for you so far?

Quote of the week:
"Experience varies depending on the amount of equipment broken."
-A warped quote from the WARP9 Screen saver for the Atari ST

This message is being sent out by JYBOLAC (Just Your Basic Online
Atari Computer) with some quick announcements about various meetings and
activities. Hopefully if nothing else, you'll find the above quote at
least useful. :)

-= ATARI COMPUTERS AND GAME SYSTEMS MEETING IN DALLAS =-
Meeting in the area of 635 and Josey Lane. Great chance to get
together, pull out various game systems and play other opponents in your
game of choice on that system. Also showing a server system for the
Atari Jaguar game system, and other topics yet to be announced. Looks
to be fun. If you'd like to attend please drop me a note to RSVP at :
greg.goodwin@fmlynet.org

(Note: If you are no-where near Dallas (for those that live in other
states and countries besides Texas) It is OK IF YOU CAN'T MAKE IT.)
(grin) Got a few messages from people in other states and such
apologizing. This is really understandable.) ;)

-= ATARI JAGUAR GAMERS LIST =-
Randy Femrite, being the absolute Jaguar fanatic that he is, is
putting together a list of the Jaguar players throughout the world. He
has only had this request out two weeks and already he has gotton 65
replies. He would like at least 100.
If you are curious how many Jaguar 64-bit game system players there
are out there, jump on in and tell your friends to give their
information to:
Randy@atarijaguar.net -or- Femriter@aol.com

-= MEGA ATARI LIST 2000 =-
It was a year ago when the first Mega Atari list was put together
(and several have existed before that, like Sir Smedley's list) and now
JYBOLAC would like to update that list. The idea is hopefully bring
together Atari fans from around the world both for the sake of penpals
and trading, but maybe to help establish meetings of Atari users in a
particular location. To have you and your friends added to this list, just
write to:
Jessica Cornn - beadsandbangles@earthlink.net

-TONIGHT!!-
-= ONLINE ATARI (Thursday Night) CHAT: (Weekly Atarian hangout) =-
It's always a great pleasure to kick back in the tail end of a week
and talk about Atari systems, trade hobby secrets, and gab about
everything under the sun. Join us at:

http://stargate.cs.swau.edu/atari

Meeting times....
Pacific: 6:00 pm Mountain 7:00 pm
Central 8:00 pm Eastern 9:00 pm
U.K. 3:00 AM.
Germany 4:00 AM.
China 10:00 AM.

A great remainder of the week to everyone.

Hi Derryck,

Must be hell to be so strictured by ones upbringing, but on the other hand I've
been told it can be fun!!
As to my Newsie problems, I assume mean the dropping of line ... I think that's
my ISP not Newsie. If it happens, I just save for later transmission.
On another topic, remember I translated GTLook 2 for you, it had four languages
embedded in the code and defaulted to german. I have found that other multi-language
programs use the trick of if you hold down ALT while you double click on the
program, it comes up with english. Doesn't work with GTLook, but a hint for other
programs.

Bob.

GEM-View spits out: "unknown data compression algorithm 0 (0x4)."

There's plenty of .tiff information at:

http://www.faqs.org/faqs/graphics/fileformats-faq/part3/
section-147.html

It points to some faqs and software at: ftp://sgi.com/graphics/tiff/

I couldn't unpack the .tar file containing the software, even using
the Minix partition on my ST, it whinged about being unable to create/
open directories. Could some MiNT hacker build this stuff and distribute
a binary ? This has already been done with JPEG software.

Very informative article :-)

I saw a couple of Syquest EZ135 removable cart. drives at the club a few
months ago with missing heads, so the problem is a little more widespread
than the ezyfliers.

Hi !

I noticed that there was a posting on this group
concerning trouble with a Syquest drive.I missed the earlier postings,
so I do not know what sort of Syquest is being referred to.

I had posted the following article on Atari Chat, and I was told that
the information might be of use to members of this NG. This article
refers to the Syquest ezflier that uses removable cartridges.
Here is a slightly cut down version :-

I purchased a new Syquest ezflyer a couple of years back which
worked brilliantly until a few months after it's guarantee expired.In
the meantime, I had not realised that Syquest had gone bust,and no one
wanted to try and repair it. I had a stack of cartridges with all my
work on, and no way of getting into them.

Symptoms :-

The drive would cease to function after it had been running for a
period of time - the busy light would not come on. Gradually this
period of time became shorter and shorter until it failed to activate
on turn on.

I found a secondhand 230mb Syquest ezyflier for sale in the small
ads, and desperate to retrieve my data I paid well over the odds for it.
This replacement syquest duly arrived, and I plugged it in and off I
went again..great !

After a few weeks, this replacement drive started to exhibit the same
symptoms as my original one - after a period of time it packed up as
well ,and an examination of the insides revealed that the drive head had
come off.

Now I had two dead syquests ! I was eating the wallpaper !

There was nothing left for me to do but poke about inside to see if
I could identify any obvious fault such as a broken circuit track,
blown diode etc.

A friend visited me and told me that his syquest ezflier broke it's
drive head when he swopped a cartridge.That got me thinking, and I took
a second look at my broken units paying special attention to the tiny
little switches that are activated when a cartridge is inserted, and
also to the other mechanical components.

What I discovered :-

The bearing, upon which the head pivots to read the cartridge
had become slightly stiffer.By slackening off the screw* slightly that holds
the pivot shaft in place (and adding a small drop of watch oil), the
Syquest would burst into life ! In fact it has been running again with
no problems for the last few months.

This would also explain how the drive can shed it's head,if the
pivot arm seizes while in use, then the return spring tension is
unable to swing the arm out of the way. Insert a fresh cartridge and
you lose the head !

So if any of you have an apparently dead syquest,this remedy is
well worth a try. One last thing though... Gently remove the eject
button from the casing by very gently (they tend to break off !)
pressing the two small lugs inwards from the rear of the front
panel.If you try to reassemble the syquest back into it's casing
without first removing the eject button,then you will probably break
the eject switch... as I did ! Lesson learnt !

(* Do not unscrew too far - the magnet attached to this assembly is
very powerful and you don't want to damage the fragile coil that
operates the pivot arm.)

>: BTW, I assume that you know that you can quite easily modify your setup so
>: that the controller box gets its 5V from a "wall wart" PSU, so you don't need

>Details, please. I just got a SLM804 out of old demo stock, and
>need more information. Have a socket left for a wall wart, and have
>PCB drawings for the controller. The hard part is probably mechanical.

The approach is to unplug the laser from the controller, and reestablish the connection with a back-to-back pairing of a matching plug and socket. Wire all the connections through pin for pin EXCEPT for the four +5V lines. Solder yourself a suitable socket to the +5V pins on the _controller_ side of this contraption (check in the handbook or your PCB layout diagram for details), and take another wire from the socket to one of the ground connections (chassis ground should be fine). Hopefully, you'll have found a socket which matches the plug on the wall wart - in any case, make absolutely sure that it's set to 5V, and that the polarity switch is set properly before powering it up. I'd strongly recommend a regulated supply, or set the voltage control to a lower voltage (if possible), and check with a meter to make sure it's not over 5V!

I put that assembly into a metal box, which also contained LED extensions of the BUSY and FAULT lights on the controller box and a 7805 regulator.

If you don't mind fiddling with the innards of the controller, then a neater approach is to snip through the 4 connections which carry the 5V from the connector to isolate them, and connect your PSU across the nearby electrolytic capacitor.

As I said, there's another mod around which involves some component replacement - doing this mod means that you don't have to power the controller up if you aren't using it. I don't have a note of it now, but I got it from the web somewhere.

Legal stuff - this is all at your own risk, etc etc.

HTH.

Shame. I didn't even know that was out there. Ah well. That's half the
reason I hang around here in the ST community... to catch the last fleeting
vapours of a proud computing era. Almost like being part of a fireside watch
or dawn patrol.

Thanks indeed Maurice for fanning the embers with us all this time.

Hi, Looking for a RAM upgrade for a STfm. Anything considered - perhaps someone has a spare board? Ian@techsoftware.freeserve.co.uk

3292. falcon upgrades

Newsgroup: comp.sys.atari.st
Date: 2000-09-29 00:00:00 UTC
From: steve.rodgers@ts-associates.com
Message-ID: <39d452c7.66065547@news.cix.co.uk>
Source record: 56976

Dusting down my falcon after a period of non-use.

Still waiting for Mario's ethernet iface to complete, but until
then...

Right now I need to upgrade my falcon - it's a a standard 4Meg falcon
with fpu. I'd like to upgrade the CPU and memory but haven't been
keeping up with what, if anything, is still available.

A couple of years ago I'd been looking out for either an Afterburner
board, or a Nemesis, but they were scarce.

What can I buy right now, that works well, has plenty of support from
tos, mint, and hopefully bsd or linuxm68k?

I've tried watching the for sales but that's difficult to keep up
with.

All recommendations appreciated...

Steve

3293. FREE Atari Computer Catalogs! Also on Web site and FTP!

Newsgroup: comp.sys.atari.st
Date: 2000-09-29 00:00:00 UTC

Body handling: HTML body converted to readable text

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/
Web info in my Signature attached to the bottom of any of my messages!

am swamped and I find it hard to keep up with reading the NewsGroups.

Wanted: Mega ST4. Willing to pay up to $100 U.S. Read on if interested!

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

Does anyone have Wings of Death for the Atari ST? Can it be send to me by e-mail or something? in images would be fine. I'm really looking for that game as my 2nd disk is damaged!

Also, I have seen that there is a part 2 as well?

Thanks in advance,
Tom

Hi Tom,

hope I'm not talking about a game still commercial, but it looks from
their home page that Thalion/Eclipse have made both 'wings of death 1'
and 'wings of death 2,Lethal_xs', PD or something. I leave it to you to
determine the legality of it all, but they are available at said home
pages:

http://cus.org.uk/~alexh/games/wod/credits/credits.html

http://cus.org.uk/~alexh/games/lethal_xs/credits/credits.html

Bob.

Quite right Jo.

I soldered a fuse board (for both 5 and 12v lines) onto the PSU then
suplied the power for the MB and the drive from there.

Hi Daniel,

I must say I find it hard to believe that a company that was able to build and market the Milan I, a very very good computer, could be so inept as to fail to seek definite sources for the hardware before even the design stage, let alone get other bodies, eg Motorola, involved. What was so different with the Milan II project that they look like failing, from the Milan I project where they manifestly succeeded. I just don't get it.

Bob King

3303. [HELP] PC-Speed installation instructions

Newsgroup: comp.sys.atari.st
Date: 2000-09-29 00:00:00 UTC
From: french-lines@usa.net
Message-ID: <8r2sdc$e4n$1@nnrp1.deja.com>
Source record: 56987

Hi,

Many years ago, I acquired a "PC-Speed" hardware device from SACK Electronic GmbH, which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

>designed with out-of-production chips :(.

Well reading the STC report on Bengy's site (http://magicos.de) says that it's the main CPU 68060 chip that has been out of prodution for a couple of years now.

It does mention the possibility of using a Coldfire, which is very similar to the 060. Only a few modifications needed to make it work, and the Coldfire is capable of going up to 400Mhz.

But why did they develop it for a CPU that was about 5 years out of date, and not even in production. It would have taken dedication and hard work to get most Atari software working on a PPC (or even G3) but I think it would have been worth it.

If the people making the Tempest can do it, why can't Milan. (and I would have thought it was more difficult making a Falcon run a PPC, than a completely new motherboard)

According to an electronics friend the best thing to use is Isopropyl
Alcohol as it leaves no residues, you can get 15ml bottles of it, ours
came with a CD cleaner.

Hi Lyndon.
I couldn't find the STC report on Bengy's site, but according to Motorola's site looks like the 68060 is still in production. Don't know about availability though. I've heard that 68060 is mainly used for embedded systems, and still popular, but is the last of the line. In a sense Coldfire it's a better option because is still under development and also cheaper, but a last-minute change is bizarre, specially because some developer's machines were apparently delivered.

Let's wait and see what Milan has to say, but what I definetively won't buy is an AMD-powered Milan (like some rumours say it's being explored).

Daniel

This actually happens alot where I work. Sometime, but not
all time it simply beyond ones control if some chip maker
suddenly decides to obsolete a certain package type.

That could be interesting. Do you know how compatible these chips are?
More insight would be neat to know.

Agreed. I think if someone wants a 060 bad enough, there is the
hades060 which appears to be fairly well supported considering
the market we are dealing with. Many pricey, but a G3 based
system could make a heades060 look like a good deal price wise?
Intersting idea anyway. ;-)

> If the people making the Tempest can do it, why can't Milan. (and I
> would have thought it was more difficult making a Falcon run a PPC,

That is the same assumption I would make.

I hope milan gets their act together before it's too late.
It seems to me if they would market the Milan I to the USA
they could of gained more finacial backing and so on.
Pity, would of probably gotten one if obtainable locally.

Source record: 56994

The mystery is solved. And as usual, totally operator error! <G> Or, rather, his forgetfulness.

On my Hades, I have HDDRiver 6.22, because I could never get 7.54 to read my ZIP drive or my Konica drive. So I reverted to the older version. Also, dialog boxes don't display correctly in 7.54, I suspect due to the graphics resolution I'm using.

Anyway, I had forgotten that only 7? and after allowed you to create both TOS and DOS compatible cartridges. And there was a place to select this when partitioning. I relearned this after I went to work and took new carts to partition with me. I have a TT at work with 7.54 on it, and that's where I relearned everything. With the carts formatted with the TOS and DOS option on, the Hades reads them fine.

I sure am glad, 'cause I didn't want to believe there was anything wrong with the Hades. <G>

3315. The Westfront PC Translation Project

Newsgroup: comp.sys.atari.st
Date: 2000-09-30 00:00:00 UTC
From: pap3@dana.ucc.nau.edu
Message-ID: <8r45nk$5e4$6@usenet.nau.edu>
Source record: 56899

Hello,

I am the author of Westfront PC: The Trials of Guilder, a new
public domain text adventure for the Windows 95/98/Me/NT/2000
operating systems. WFPC has been in development for some time.

Homepage: http://www.geocities.com/dunric/westfront.html

Originally conceived on the Commodore 64/128 in May of 1993,
WFPC has grown considerably in size and now rivals online MUDs
, both in size and overall gameplay.

In addition to the release of WFPC on CD-ROM (in April of 2001,
with 50% of the proceeds going to a charity of the buyer's choice)
I am looking to port the game to the following platforms:

o - Macintosh (68k, others)
o - Unix/Linux
o - Atari ST (520 and 1040)
o - Amiga (600,1000,1200,2000,etc.)
o - TRS-80 (Models 1-4, Color Computers 1-3)
o - ZX Spectrum
o - Apple II/IIe
o - Atari 8-bit
o - CP/M (2.2 or less, with terminal emulation)
o - TI-99/4A
o - Wang (300 meg disk packs not required)

In addition, I'd love to see Westfront PC translated to
large scale computing devices, including:

o - DEC PDP-10
o - IBM 3271/72
o - IBM 709

And if anyone wants to tackle porting the game to the Cray-2
Supercomputer, be my guest. =)

I'm serious about the others, though.

Written in BASIC, WFPC should be convertable to most
modern systems because of the limited use of language-
specific functions and subroutines. As long as the
computer system can get by with Minimal BASIC or
Tiny Basic commands, then WFPC is possible (PRINT, FOR/NEXT,
IF/THEN,DIM,COLOR,CLS,MID$,LEFT$,RIGHT$,RND/INT or equivalent)

Please direct all comments, suggestions and inquirements to:

dunric@yahoo.com

Regards,

Paul

The first release of a brand new Atari STE emulator for Windows is now available. "The Steem Engine" as it is called will run a lot of the game disks available, it's at least as compatible as other freeware emulators available as far as we can tell. It's also designed to be particularly easy to use with a nice interface.

We'd like people to try it and tell us what they think - it is only a small file & doesn't have a nasty installation process.

Have a look at http://steem.atari.org

Hope you enjoy the latest recreation of everyone's favourite computer!

|I have a stupid question concerning Papyrus Gold. How does one set Papyrus
|to do double-spacing??

Via the spacing control on the bar at the top. There are two
controls:

First sets the spacing to be directly in points (will show integer
eg 13) or in what I take to be multiples of what you have set (will
show a decimal eg 1.4)

Second (up and down arrows and the spacing number itself) allows you
to set the value of spacing required.

Using point size of 10, either set spacing to 20 or 2.0 (depending
on whether you prefer points directly or multiple of point size).

Hi all,

I've just looked at Maurice's last Atari page in Computer Shopper. It makes very sad reading. It is a definitive obituary of Atari. Why now?

Hi ,
Does anybody know where to obtain this ST game Grandad 2

I know D-Bug has it on one of their menus (161) but its not
available for download on their site. Only menus 1-157

I think the game was written in Stos .

Cheers

Hi Daniel,

Try http://bengy.atari-computer.de as I think this might the report.

I think the Coldfire is for embedded systems, and there is a version very similar to the 060, but lacking a few instructions. I'm not too sure though as it's been a long time since I read the 68k FAQ.

I expect the developers machines were running old second hand 060s.

The reason why they could use AMDs is becuase they could be scrapping the idea of it running TOS, which totally ruins the point of it being TOS compatible.

TOS or any Atari OS for that matter would be difficult to get it running on an AMD, let alone the programmes. Use a G5 instead, when it comes out. I reckon ST programmes would run about 1000 times faster on G4. (only a guess mind!)

A PPC is as incompatable to 68K as is a x86.
68K code has to be emulated on both machines.

>
>Chris Thorley.
>
>

Yes the article wasn't very good and not true to life. It gave the
impression that Computer shopper was the ONLY thing the Atari (all TOS
machines) had going for it:(

Coincidentally the Amiga section has also had it's last hearing,
although I didn't see/notice the Acorn Archie this time.

Although any publicity is better than none, I always thought of Maurice
as an advert for FaST and System Solutions as he doesn't seem to be able
to steer away from them.

After reading the column, well I didn't manage all of it!!! which is
saying something for me! I felt the message that he gave out was; give
up and get rid of your machines like I'll be doing, buy yourself a Mac
or pc as the Atari's and my obsolete Falcon have no place in the
computer world anymore and on top of that there is no software is
available for them!!!!

This is sad as many people will take his word for it, as it's a national
publication. And as we all know this isn't totally accurate!

It makes you wonder whether the publisher has given it the heave hoo, or
whether Maurice himself has called it a day, I feel from the article
that it's the latter. But he shouldn't have committed to comments that I
feel are untrue though!

ATTENTION RETROGAMERS, COMPUTER COLLECTORS, VIDEO GAME FANATICS!!!!

WE'RE BACK!!..

CCAG 2001
(Classic Computer and Gaming 2001)

If you like collecting old computers, video games, and enjoy using them
still, then come join us on:

June 23rd, 2001
9AM till 6PM

National Guard Armory
IT'S ON ROUTE 57!!!

(actual address)
3520 Grove Avenue
Lorain, Ohio 44055-2048
(On Route 57, going North of I-90/Route 2)

IT'S FREE!

Both vendors and attendees!
Computer User Groups and vendors inside, flea market outside!

Setup: 22nd, June, 2001
6PM-10PM

Please Call Ahead for Reservations:

Jim W. Krych jwkrych@n2net.net
440-979-9295
Fred M. Horvat fmh@netzero.net
440-286-2566
And these other CCAG 2001 organizers:
Thomas J. McLaren sirthomas@uk2.net

Please visit this site:
http://tomheroes.com/ccag.htm

As of 9/29/2000
User Groups:
Erie PA Atari Group
TI Chips
Cleveland Classic Atari Group

Vendors:
Tomorrow's Heroes
Retropolis
Songbird Productions
Video Game Connection
Ramcharged Computers

People/Organizations:
Fred Wagaman
Alan Hewston
Thomas Mclaren
Andy Frueh
Tim Snider
Curt Vendel(Atari Historical Society)

We are looking to do a "Classic Game Experience" this year!
One room is going to be set up for playing classic computer and video game cartoons and commercials. The other room is going to be an emulator room- MAME, etc. We are hoping for some people with arcade systems to bring them- will probably need a small generator for that.

See ya at the CCAG!

Can't help with the header, but FWIW, they are multi-page CCITT TIFFs,
apparently a format designed for faxes. This question has been raised a
few times but so far nobody has ever found an Atari program which will
handle them.

>Very informative article :-)

>I saw a couple of Syquest EZ135 removable cart. drives at the club a few
>months ago with missing heads, so the problem is a little more widespread
>than the ezyfliers.

Thanks for that Derryck.

Yes, I think that it is a widespread problem, and possibly not only
confined to drives with removable cartridges.

I now, never insert a cartridge into my Syquest without first checking
with a penlight torch that the head has returned to the rest position
at the rear of the unit.

I recently had my Connor 500mb IDE drive fail after many years of hard
use. I took it to pieces and discovered that the arm upon which the
head is situated, was well and truly stuck in the mid position. It looks
as if mechanical failure rather than circuit board,or magnetic disk
might possibly be a major cause of HD failures as well.

Has anyone else had any experience of this ?

Cheers,

~ Paul ~

One problem with current 060s is the too often-occurring exclusion of the FPU
unit, making it a 68LC060, IIRC.

STiNG is indeed not compatible with the AES in MultiTOS (GEM.SYS) due to a
missing function in the AES. You must install a patch (ra_yield IIRC) to
run STiNG with this configuration.

I have a Yamaha 6416SZX CD-RW drive for my Mac. Is there any Atari software available to use this drive to write CD-Rs on/for my TT? I'm presently using a Syjet to backup the TT, but would prefer to use the CD-R drive for the TT.

I must be missing something. Your "RARE" diskless Atari 520ST looks
like every atari 520ST I have ever seen. I have 3 but, didnt know they
were "RARE". And what is meant by "lots of ram"?

3350. Falcon Questions

Newsgroup: comp.sys.atari.st
Date: 2000-10-01 00:00:00 UTC
From: Puppy Dawg <swallow@intergate.bc.ca>
Message-ID: <39d82e79@newsserver1.intergate.ca>
Source record: 56853

Hi all.

I've got some questions re: the Atari Falcon. I've been using an ST on and off for the last little while, and would really like to replace my PC with something like it. I do not think that my 1040 will handle that task. But the Falcon might. But first, I have a whole pile of questions...

1) I am interested in doing music work, both MIDI and live recording. How well would the falcon handle this? I'm looking around some of the stuff I did find, and noticed the Soundpool Analog 4/8. Anyone have any opinions on this? How about the software side?

2) Does FalcAMP really work? I have a large collection of audio files of various formats, and it would be a great benefit to be able to play them...

3) Can anyone explain the Falcon's RAM system? I've been catching bits (no pun intended) here and there, but it still seems sorta... uhhh...fuzzy....

4) What about compatibility? What are the rules (if any) on connecting PC devices, like modems, printers, scanners, and drives? Anything I need to worry about?

5) I've been looking at Wizztronics. Opinions? Good place? Bad place? Rip-offs?

6) Does *anyone* have a Falcon for sale around Vancouver, BC? I'd feel a lot better about not having to send a large cheque through the mail, and then worry about getting things back/through customs... (Yea, I'm Paranoid, but after dealing with microsoft, can you blame me?)

7) What's the monitor deal? Can someone please explain this on to me? Followed by, how would I connect a Falcon to a SVGA PC monitor?

Well, that's about it for now. If you know of good Falcon websites, I'd be very grateful for URLs. I may have to move away for university (yea, I'm a youngin, but I've grown up with Ataris, and would like to continue the trend), and would really love to have a reliable, compact, powerful system. Any help would be greatly appreciated.

Puppy Dawg

Hi John,

YES!, this has been happening with me too. The first post also shows up as the last posting, except that there it is repeated about 10 times. This has been going on for maybe 1 to 2 weeks now. I thought it might be my server too, until I read your post. My server is aa.net, and I believe it covers most of western Washington. (USA) I wonder if this is a problem with the atari newsgroup??? Anybody else having this going on? It's not a big problem, but I'd like to know what's causing it.

Hi

I do have the software you are after in my PD library, 'Grandad and the
search for the sandwiches'.

Unfortunately it is SHAREWARE and you will have to contact the author
for the code to allow you to enter the 'Funland' part of the adventure.

Thanks for the kind offer Steve.

Unfortunately , I already have the Shareware Version of Grandad 2
but I've had no Reply off the Author Ian Scott , which I
suppose is not really surprising as the game was written back in
1992 .

So I guess Grandad will forever be stuck outside the fun park
:-(

>->Third, HDDriver come up, detect all devices an let MagiV boot from C:
>->That's all. Evry day since i used CT2

hum, I have an idea about that

Have you patched magic.ram with newbeat patch that allows to not
watching after ide hd when such a device is not present ?

If you have done so, falcon boots on ide (cecile) and magboot launch
magic.ram witch ignore your ide hd and boot on the first scsi device.
So you must get an original version of magic.ram and just patch it
with the centek patch.

but perhaps it's another prob...let me know !

>I think the Coldfire is for embedded systems, and there is a version
>very similar to the 060, but lacking a few instructions. I'm not too
>sure though as it's been a long time since I read the 68k FAQ.
[...]
On page 15 in the ST magazine (Dutch) of april 2000 the Coldfire
question is looked at for the Milan.
About 90 % of the instructions of the 68000 are in the Coldfire
series. A problem can be the missing DBcc and ROR/ROL instructions
but those can be handled in software.
There are experiment-boards from Motorola programmable in the normal
Motorola S-record away (there are 2 RS232 ports for this) but there
is a bus with 120 lines containing signals (32 A, 32 D) going out
that looks very much like the old 68000 busstructure.
So putting it in a TT via VME, in a Falcon via Expansion and in
MegaST via mega-bus can be done really simple.
And.. the cheapest Coldfire CPU is 90 MHz!

Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST

Hi!

I'm wondering what speed people are getting on there IDE drives.

I have the TUS interface fitted on my STe and according to DDSTEST.ttp
I'm getting a transfer rate of 260k/s on my 48x cdrom. Also with this
program I have, which reads 10meg of the hard disk, I'm getting 10meg
read in 75 seconds.

Why is it so slow? The hard disk (seagate EIDE) seems to be getting a
transfer rate of 140k/s. This is crap compared to even an ACSI
megafile.

Does anyone have a program that displayed the speed more correctly, as
I can't believe it's that slow.

Same as here, looks normal for me. First time with the CT2 i was
wondering too about that setup but i canï¿½t found another way to use
cecile after magic is started. After magic only hddriver is used.
The hole chain runs since two years perfecly.

Looks like cecile doasnï¿½t work behind magic.

Do not change a winning team :)

I underSTand your bitterness.
You have had some bad experiences.
I too have had some unfortunate experiences, but fortunately
Woller came through with my n.aes CD-ROM plus some freebees like a clip art CD
and a ton of Revolution mag CD's.
Thank you KonSTantin Woller!
So this only leaves ICD Inc as the outSTanding bad experience,
with chips ordered and paid for but not delivered after more than a year!!

With regard to Rodolphe (to not lose the thread)
I received my CT2 board just fine, but underSTand kellis has had problems. :-(
Unlike the software market,my experience (via Mario Becroft) is that the
hardware market is much more risky Jo.
I can perfectly underSTand Rodolphes position.
For example, all the work done on Phenix is wasted when those rotten programmers
abandonned the project!! I wouldbe very very very careful when making hardware
that I had customers up front before I even STarted _thinking_ about creation.
Mario has done wonders on a shoestring. but his market has not developed.
For example, I think his products would do extremely well in Germany, but the
import duties they have there prohibit this as the coST of his products
then become too expensive for the user. yet because of the coST of necessarily
small production runs, the price cannot be lowered enough tomake it feasible.
This is sad for german atarinauts.
I know the insanity of french customs caused heart attacks for Rodolphe and I
over the CT2 board. If Rodolphe change d'avis, je comprendre. His experience
with the atari hardware market is much better than mine or yours, aslongas I
have not paid for something that I have not received, I wish to encourage, not
discourage, Rodolphe.

c'est tout

I can confirm that they did release a German TT TOS, in fact a TT I
bought from MGI a few months ago is completely German :)

Falson also has a German TOS, you need to have a program that fiddles
with the NVRAM to configure it.

Yes, all those signals exist, but when I had a contract project job
away from home, I took my TT and a mono monitor from a PS2 (otherwise
yecch) and simply plugged it in. Got some odd effects, because the
it did not have monochrome detect wired, but it worked well enough.

Hi

It's a 14" monitor the 124 are 12", it has a tilt and swivel stand AND
is more pleasing to the eye:)

What no one else has mentioned is that it has a flatter screen, even
compared with a SM125! So you don't get as much glare from your
surroundings.

The base is designed to sit neatly on top of a Mega STE or TT, and and
has a slot on the front side of the base this is just right for sticking
rulers, pens or anything else neatly underneath.

I have a Syquest EZ135 that I bought about 4 years ago. I used it on
several different systems, including an ST with a Link II. I was quite
delighted with it. Unfortunately about the time Syquest went under it
started refusing to mount disks and this was true on ALL the
platforms. Despite my best efforts I was unable to get it functioning
again. So here I sit on 5 disks waiting for a used Syquest 250 with
which supposedly they are compatabe to come along at a reasonable cost
so that I can once more access them. Iomega's "click of death" was
well known but I have heard little about Syquests. Might be time to
back up if you haven't already .

ciao larry

Sad to say I have to agree with you... there's only so long you can rehash a seemingly ever-smaller set of subjects - emulation seemed a fairly regular topic, but even that's showing signs of decline (no more Pacifist or Winston, Gemulator turning inexorably into SoftMac, although the appearance of Steem is welcome, with Saint to come...)

hi

I have some TOS-DOS formatted SyJet cartridges, and when I try to view
them in MagiC 5.11 on my CT2bFalcon I get a TOS error -46.
Yet, in normal TOS (CENTEK 7 or 4.04) there is no problem opening
the drive window, same for MiNT(w/ n.aes).
Why can't MagiC view my TOS-DOS SyJet(1.5GB) cartridge?

I can copy to and from the cart in TOS or MiNT, but I can't use
Kobold2.5
to do so as it reports incorrect sectors, AFAICR
another puzzle. I would have thought Kobold disk handling would be more
capable than Ataris??

maybe I need Kobold 3.5? (even if it is in German!)
ken

I am cross posting this as I don't know if this is a hardware/tech
problem
or a software problem.

This appears on the SVGA monitor

> in there somewhere as well as the TT-High ECL output...

This only appears on the TTM194/5 and compatible monitors.

The TT will drive any SVGA up to TT medium res from this socket AS LONG AS
THE SOCKET IS STANDARD, ie, I don't know about the COCO board.
>
> Alternatively connecting to an SM124 or similar would be a good start...

NO. See above.

> Also..It has a Matrix COCO in it ...the manual talks about a 9-pin
> output but mine has a 15pin HD-Dtype...is that a straight SVGA?...

No idea, try it on an old 15 pin SVGA.........
>
> And on the subject of the COCO...can it be expanded to 4Mb (mines a 1Mb
> one) cos it'd be an easy enough project for me to do, if anyone knows

> off the 1Mb board it's got anyway....I woudl expect to be able to sell
> the upgrade for less than 50 UKP (depends on what the memory costs me
> really....could be as low as 30 UKP....)

I have 2 TT s and TTM 195s plus various VGA and SVGA monitors that all work
from the 15 pin D type.

As I said I'm not familiar with the COCO board.

Of help?

Barrie.

>>>of the list (the date stays the same)! If i click on any one of those
>>>last repeated files, all get highlighted. The XOVER.TXT file shows
>>>a "Fatal syntax error" message at it's end.

With Newsie 0.96 I had something similar, not when downloading, but when closing a NG after reading (offline) with a number of deletions scattered through the posts. Next time, I found whole groups of posts apparently

repeated. Took some time to realise it. I had to manually edit the Xover.txt (after quitting the program) against the actual list of posts in the respective folder. It wan't only in this NG, but also in an Amateur Radio NG: both these NGs have a very large number of posts.

Since getting 0.961, I haven't had that problem, only an occasional duplication of one or two posts: not the actual posts, but the titles and numbers. I do not say the improvement was because of the upgrade, because I don't know, but it happened.

I do hope you can get this solved: I feel for you.
Cheers,
Charles.

Hi Lyndon,

I agree that's one interpretation, but I cling onto the thought that Milan are the people that successfully produced and marketed the Milan 1. Surely they would not be so stupid and short sighted to use such a cheep ploy, to what end for gods sake, it's not as if time will not out the truth. I hope desparately that I'm wrong, but the more time goes by, with out the 'Press Release' we have been to wait for, the more I think the worst.

Agreed on the "helpful" part. Roger Burrows responded to my email
about CW-7502 support by adding it to the program (I have a beta copy --
it'll probably be released in a few months). He also is creating
(once again, it's in beta) a program to let you verify your computer
will work with his software. I highly recommend him.

The basic 1040ST has a 19.2K serial port and 1 MB of RAM. If you do
not have a hard drive, running a browser will be rather difficult.
Email should work fine.

Because of the limited serial port, there is no point to having a modem
over 19.2 (that is, a 28.8K modem). These are found very cheaply on
the used market.

ISPs are specific to area, but if the ISP rep understands what a PPP
connection is and the logon process uses simple ASCII, you should be
fine. (A good sign is if the ISP still offers SLIP). CHAP is bad.

To get online, you will need a handful of programs. I use HSMODEM7,
STING, MYMAIL, AFTP, and NEWSIE. I also use CAB, but that's
commercial. Unlike the Intel world, suites are not common on Ataris,
so most of us make do with separate programs (which are much smaller,
anyway) to do each thing.

You may wish to email atari@chebucto.ns.ca which is an email listserv
for the Halifax Atari group. I know that some of their people have run
the internet on the system you mention, but 1 MB is mighty tough!

Hi John,

Yeah, same here. I don't know if that would be virus. Doesn't seem like it. I'm using Newsie .96.1, and in Newsgroup settings I have "maximum number of articles" set to 400, and "most recent..." also set to 400. Maybe I should try changing those.

Are we the only people experiencing this????

From: Don <dons@qnet.com>
Message-ID: <39D9694E.C2D70BF9@qnet.com>
Source record: 56817

Would like to take my Stacy2 to 4megs. I can see it takes SIPPs but, are they parity or non-parity. Is there anything else I should know about the memory needed to do this.

Does anyone have suggestions where to find the SIPPs. Ive tried local but, nothing.

Thanks in advance,

Don

3396. To Falcon or not to Falcon? that is the question. (Was: Falcon Questions)

Newsgroup: comp.sys.atari.st
Date: 2000-10-02 00:00:00 UTC
From: Puppy Dawg <swallow@intergate.bc.ca>
Message-ID: <39d98345@newsserver1.intergate.ca>
Source record: 56818

Hi again.

I've looked over the replies, and now have some questions to put out to all of you.

It seems to almost be a tied battle between the Falcon and the PC for audio work. Both replies posted suggested that I should probably look towards a PC based solution. I would like to hear how some of you managed to get a PC to do what was required.

My quibbles with my PC:
- HW reqs keep climbing too fast.
- SW doesn't always work when it says it will
- This damn HW keeps dying on me. I've had to send back a hard drive again, and my scsi/video capture board has been tossed, as it was crashing the computer ever 10 minutes. So, now, that $300 CD burner is now just taking up a drive bay...grumble....
- This damned OS. I cannot stand Windows. Switch to linux, you say? Right. I have a hard enough time getting devices to work when they have full driver support...
- MIDI has never worked quite right. (now the drivers have disapeared, and I haven't had the time to reinstall, so there is now *no* MIDI support....) I've used a couple of MIDI sequencers/trackers, and the synching/timing in them is....hideous. The usability of the synching and timing ranges from "almost there, if you're half deaf" to ""holy *$(*&#^^ what is is doing?"

Granted, my PC has an utter load of crap sound card (SB PCI 128. It's never been great.), but it should be fast enough to run a bloody midi sequencer! I do not consider 300 mhz w/ 64 megs ram to be too slow for that task. I know this is an Atari newsgroup, but since many of you are musicians, would any of you have suggestions/ideas on this?

Ok, now where was I? Ah yes, the Falcon. Is it worth me finding a Falcon? I would like to continue to use an Atari, but I know my STf is not up to the task. Would i be better off getting a "fully loaded" STE, and then plunking the rest of the money into a PC?

I'm putting that out to you guys, because I think that you can give me an unbiased opinion (I mean, seriously, look! no Amiga anywhere! :)). Hope someone can help me... ("help me Atari-Wan, you are my only hope...")

Thanks again.

Puppy Dawg

Where's the problem? Since there is a huge market for the Milan II,
Motorola decided to produce all the 68060 chipe that are required for
the Milan II project, didn't they? At least this is what Milan Computer
GmbH has been telling all the time, presenting Motorola as one of the
Milan II project partners :-).

I suggest that you try the Falcon for a while before you decide to get rid of the PC...

> 1) I am interested in doing music work, both MIDI and live recording. How
> well would the falcon handle this? I'm looking around some of the

Very well, although I don't think it's quite up to PC-standard. For plain midi-work I don't think you can find anything more reliable than a Falcon or ST, but the Falcon really has too little memory and way too little processing power for audio. I know that a lot of people use Cubase Audio and like it a lot, but a PC with a good soundcard is just so much more powerful.

> 2) Does FalcAMP really work? I have a large collection of audio

Yes, although I haven't tested it on a plain Falcon.

> 3) Can anyone explain the Falcon's RAM system? I've been catching bits (no
> pun intended) here and there, but it still seems sorta... uhhh...fuzzy....

What do you need to know? The Falcon can have either 1, 4 or 14 megs of RAM. With a CenturboII, Mighty Sonic or Afterburner you can have a lot more, atleast 64Mb. But take my advice and stay away from these, they are for enthusiasts only (and also very hard to find).

> 4) What about compatibility? What are the rules (if any) on connecting PC
> devices, like modems, printers, scanners, and drives? Anything I need to
> worry about?

Winmodems and WinWriters only works with Windows, otherwise you can use pretty much anything. Both IDE- and SCSI-drives work (as a rule - some drives won't work), and quite a few recent SCSI-scanners works.

> 5) I've been looking at Wizztronics. Opinions? Good place? Bad place?
> Rip-offs?

I don't know if Wizztronics even exists anymore.

> 6) Does *anyone* have a Falcon for sale around Vancouver, BC? I'd

Almost certainly. Look at the classifieds in magazines for professional musicians. Often you'll get a lot of extra hardware and software as well, but also insanely expensive. A lot of people can't understand why nobody wants to pay $2000 for their computer-system when it cost them $3000 in 1993...

> 7) What's the monitor deal? Can someone please explain this on to me?

You can use any VGA or SVGA, oldfashioned RGB-monitors (like the old SM1224, the Commodore or Philips monitors for the Amiga etc.) or even a TV.

> Followed by, how would I connect a Falcon to a SVGA PC monitor?

With the supplied adapter.

> Well, that's about it for now. If you know of good Falcon websites,

Not much Falcon here, but you can see what happens when a normally sane person looses his mind (and quite a lot of money) when he decides to stay with his Ataris even though he has a perfectly OK PC:

3404. [ANN] NoSTalgia 0.7 is out

Newsgroup: comp.sys.atari.st
Date: 2000-10-02 00:00:00 UTC
From: ph.gerin@NOSPAM.be
Message-ID: <1ehvj1r.7q955dx6gxu2N%ph.gerin@NOSPAM.be>
Source record: 56865
Cross-posted to: comp.sys.atari.st,comp.sys.mac.apps,comp.emulators.misc

NoSTalgia 0.7 is available.

NoSTalgia is an AtariST emulator for the PowerMacintosh.

New in this release:

- Multiple partions (TOS 1.4 or better).
- New IKBD code preventing data overrun in the emulated code.
- New hard disk driver (Ver 0.4)
- Improved stability.
- Bugs fixed in the pending interruptions routines.
- Fixed internal debugger.
- Run MagiC 6 and NAES 2.0 (with some limitations).
- ...

NoSTalgia is freeware and the hard disk driver is shareware.

Infos and Downloads at <http://users.skynet.be/sky39147>

Enjoy !

From: phantomm@eastky.net
Message-ID: <8r8u7b$pn1$2@nd.eastky.net>
Source record: 56868

Was wondering if Atari ever released any kind of software to do anything with the Falcon LAN port?

Was any released for the TT's LAN port from Atari?

When using the normal Modem port on my Falcon, My modems TR light comes on soon after I turn on the Falcon. Before any Auto/ACC programs run.

Should this also happen with the Falcons LAN port if I have a LAN Modem Cable connected?

Or is the LAN port Dead until software like HSMODEM7 and STING or etc sets it up?

Also, is it possible to use 2 modems on the Falcon at the same time using the modem port and the LAN port?

If this will work, What Net software will allow this, STinG? MintNet? Iconnect?

Or is one of these ports disabled if using the other one?

I don't think so, although I've never checked.

> Or is the LAN port Dead until software like HSMODEM7 and STING or etc
> sets it up?

STiNG can't do this, this is a task for the device-driver (HS-Modem or scc.xdd).

> Also, is it possible to use 2 modems on the Falcon at the same time using
> the modem port and the LAN port?

Yes.

> If this will work, What Net software will allow this, STinG? MintNet?
> Iconnect?

STiNG and MiNT-Net won't have any problems, but I don't think that IConnect can handle more than one connection. IConnect is only designed to handle one dialup-connection, it won't even work without a modem. It will work with the LAN-port, a friend of mine used it with an ISDN-"modem" for about a year.

One problem is that the only device-driver for TOS and MagiC is HS-Modem, and it doesn't do a terribly good job with the DTR-line, atleast not on my Falcon. Ozk's scc.xdd works a lot better, but that's MiNT only.

I have just picked up a very cheap 1040ST which I would like to use on the internet.

Can anyone offer any advice / useful sites regarding:

1. Suitable modems
2. ISPs
3. etc

Thanks !

No, they do nothing for that port.
Do not change Atari LAN with (L)ocal(A)rea(N)etwork!

> Was any released for the TT's LAN port from Atari?

No, same serial port as on falcon.

> When using the normal Modem port on my Falcon, My modems TR light comes
> on soon after I turn on the Falcon. Before any Auto/ACC programs run.

Check HSModem setting!? :)

> Should this also happen with the Falcons LAN port if I have a LAN
> Modem Cable connected?

HSmodem..

Drag SCC.PRG to SETTER.TTP and have a look whatï¿½s going on.
ELSA 33K8 Modem works fine on falcons LAN port here.

> Or is the LAN port Dead until software like HSMODEM7 and STING or etc
> sets it up?

It works as normal serial port here.

> Also, is it possible to use 2 modems on the Falcon at the same time using
> the modem port and the LAN port?

No, falcon only hand ONE modem connection in one time.
Same with magic or any other m-tasking os.

> If this will work, What Net software will allow this, STinG? MintNet?
> Iconnect?

STinG use the port as serial port (To connect another atari)

Check manuals of STinG 1.26, HSmodem7, they contain any information to
use this port well.

not quite correct. :-)
I have a Sony external SCSI CD-ROM.
Since it is capable of dumping audio CD's to my hard drive,
I find I can play audio CD's through my Falcons sound system
This give me more control over variables.
I also have headphone outputs on the front and back, which
I sometimes use.
but most CD-ROM drive. it is true, only allow output through the
headphone
ports.

holding down the alt or ctrl keys works.
another option if you have HD Driver or ICDboot, is to press the key
denoting the partition you want to boot from when the logo of either
appears.
I have a very basic auto folder set up on my G: partition(logical
drive), which is my
next physical drive. If I have problems with my auto on C:\, I just
press G
when I see the HD driver intro, and I use the auto folder on G:
Note: You are still 'booting' from C:\, as that is where your *.sys file
and boot record are, but you continue the boot process on G: (or
whatever partition
you choose)

Hi Carl,

if its any help, I once had a program that needed a German version of
TOS to run. I had to run a TSR TOS converter to convert my UK/US TOS
first to run it.

Hi Ken,

Does this mean that I can get a kind of XBoot effect of multiple AUTO
folders by having a different one for each partition. If so sounds very
intersting indeed. Thanks for the tip, you learn something new everyday
on this NG, but that's what it's for!!!

Bob King.

The 144 is bigger and has a tilt swivel stand and has external screen-
resizing controls to help you lose the border if you want to...It's the
best small monochrome Atari made, apart from the almost identical SM146

Hi folks..

I've just got a TT and I need to connect it to a monitor...

In the short term..what's the pinout of the lead to connect an SVGA to the TT monitor out...I know better than to just plug it in, there's an ST-High output in there somewhere as well as the TT-High ECL output....

Alternatively connecting to an SM124 or similar would be a good start...

Also..It has a Matrix COCO in it ...the manual takjkls about a 9-pin output but mine has a 15pin HD-Dtype...is that a straight SVGA?...

And on the subject of the COCO...can it be expanded to 4Mb (mines a 1Mb one) cos it'd be an easy enough project for me to do, if anyone knows that it can be done, I'll do it....I can get nearly all the info I need off the 1Mb board it's got anyway....I woudl expect to be able to sell the upgrade for less than 50 UKP (depends on what the memory costs me really....could be as low as 30 UKP....)

Get the PaCifiST emulator and use the utility that comes with it
called MAKEDISK. It will read any Atari floppy disk and write it out
to a .ST disk image. It will also do the reverse, as well as create
blank images. It can autodetect the format of the disk or, for those
disks whose FATs lie, you can specify the number of
tracks/sectors/sides to copy.

Hi Uwe

Yes I knew that but I think it's highly unlikely they're gonna make a
"special" batch of 060's just for the Milan II.

If you ask me that deal with Motorola is just bullshit, just to get
the press interested. Where's the proof?

Wouldn't the Milan website have banners saying "sponsored by
Motorola" or whatever. You get my point.

Have you gotten this to work with sound at all? I can't get it to
spit out anything more than the distorted keyclick sound...

> Shopper to hand to check the details

Andrew Wright jumped ship years ago - he only continued writing the Atari
section in Computer Shopper as "Maurice Collins" because the page rate
was good. ;)

Maybe, Computer Shopper wanted to drop the pages.. maybe Andrew no longer
had anything to write for Ataris - no new products for review - how long
can he go on? If you ask me - and I have been keeping an eye on the
column over the past few years - the last few months there wasn;t really
that much to write about - a lot of the column was filled with letters
from readers which he answered.

Hi,
SoundPool's CDrecorder is a really great program and the compatibility
list is located here: http://www.soundpool.de/writer.txt .
There are two versions available - one for audio only and one mostly for
data (and limited for audio), so if you don't need the professional
audio features, you don't have to buy the audio version.
I've used CDRecorder (both the audio and the data version) for several
years on my Falcon and it's always worked very well.

Best regards,
Claes

Hallo Jo!

J>What do you need to know? The Falcon can have either 1, 4 or 14 megs of
J>RAM. With a CenturboII, Mighty Sonic or Afterburner you can have a lot
J>more, atleast 64Mb. But take my advice and stay away from these, they
J>are for enthusiasts only (and also very hard to find).

With the older CenturboIIA you can only have 32 plus 14 MB.
And there is of course the Magnum Falcon, with which you can have either 4MB + 8MB, or 4MB + 6MB + another 2MB on an extra Nova Graphics Card.
In this case, the 4MB are ST-RAM and the 6MB or 8MB are alternate-RAM (similar to TT-RAM).

I'd recommend to go for a CT2B (installed by Rodolphe), or an Afterburner, because the Falcon becomes way faster with these. Once properly installed, they work as reliably as a normal Falcon does. Don't know about music programme compatibility, though, but this shouldn't be a problem.

mit freundlichem Gruï¿½ aus Ahornberg

> well would the falcon handle this? I'm looking around some of the stuff I
> did find, and noticed the Soundpool Analog 4/8. Anyone have any opinions
> on this? How about the software side?

The Falcon handles it very well. 8 mono audio tracks in DAT quality and lots of midi channels (up to 80 midi channels if you get the MO-4 midi expansion from SoundPool) can be used simultaneously - which should be enough for most people. Midi is super stable and audio is very closely synced to the midi (as long as you don't try to sync it to external things). I haven't measured the latency, but it's ok for most users (as it's been for me during about 7 years or so...). The FA8 is good, but it has only unbalanced outputs with an RCA-connector for each channel. Another unit that's even better is Line Audio Design's JAM-8 (www.lineaudio.se), which has 8 balanced outputs with tele connectors instead - and someone told me the sound quality was better. I didn't get around to make an A/B-test with the FA-8 and the JAM-8 myself, so I'm not sure. The FA-8 worked nicely and with a high sound quality during the years I used it and when I got a JAM-8 instead, it was better - but maybe mostly because of the balanced operation...

> 2) Does FalcAMP really work? I have a large collection of audio files of
> various formats, and it would be a great benefit to be able to play them...

Never tried it - sorry...

> 3) Can anyone explain the Falcon's RAM system? I've been catching bits (no
> pun intended) here and there, but it still seems sorta...
> uhhh...fuzzy....

A standard Falcon has 4MB of ST-RAM, but if you make arrangements with much midi data - or if you need to edit the audio recordings with the waveforms, you'll need a 16MB-card. 16MB actually comes out as 14MB of useable RAM - don't ask me why, but I'm sure someone else has a good explanation.
There are other RAM-cards available, which add TT-RAM to the system. Some programs can be loaded into TT-RAM instead of ST-RAM - and they get somewhat faster then, but there are programs which won't run at all with

TT-RAM, so I'd recommend you to keep to the standard 16MB ST-RAM. There are accellerators around, but they're hard to come by since the manufacturers have stopped making them, gone out of business or other problems, so for a midi+audio system you actually don't have to bother... However, you should absolutely install NVDI since the screen updates in Cubase Audio are terrible without it...

> 4) What about compatibility? What are the rules (if any) on connecting PC
> devices, like modems, printers, scanners, and drives? Anything I need to
> worry about?

Modems are the same. Printers MUST be of a kind that works under DOS and I'd say that a laser printer that's HP laserjet compatible (most of them are) would be the best bet. Scanners need special software, so check out the software for support of available scanners before you buy - SCSI is the way to go. Most IDE-drives work, but you need an adaptor 2.5"->3.5", since the internal IDE-connector in the Falcon was made for 2.5"-drives. Two IDE-drives can be used as Master/Slave if you use HDDriver from Uwe Seimet as your harddisk driver. Cubase Audio can only record on a SCSI-drive, so for that reason you need a SCSI-drive. You can also burn CD's and most Yamaha burners work with SoundPool's CDRecorder 3.2 (www.soundpool.de). Some harddisks don't work well - check out my site for some more info on that.

> 5) I've been looking at Wizztronics. Opinions? Good place? Bad place?

> then worry about getting things back/through customs... (Yea, I'm Paranoid,
> but after dealing with microsoft, can you blame me?)

;)

> 7) What's the monitor deal? Can someone please explain this on to me?
> Followed by, how would I connect a Falcon to a SVGA PC monitor?

You need an adapter whichever monitor you want to use. The best to use is an SVGA-monitor and Cubase Audio works best in the monochrome mode (but you can still use a color monitor, so you can use color in other programs) since the computer is faster then.

> Well, that's about it for now. If you know of good Falcon websites, I'd be
> very grateful for URLs. I may have to move away for university (yea,

I'm a
> youngin, but I've grown up with Ataris, and would like to continue the
> trend), and would really love to have a reliable, compact, powerful
system.
> Any help would be greatly appreciated.

I've actually made the "forbidden" jump to the PC platform - and I
really do love it!
To make a PC work well costs a little extra, but when you get
sample-accurate sync everywhere, plugin effects, as many audio tracks
you can ever use (I've tried my system with 52 simultaneus audio tracks
without any problems) etc etc, it's worth it...
I like the Atari machines, so I'll always support them in my own little
way, but I'd feel bad about keeping quiet about how well a PC actually
works in music applications nowadays. Most of the rumors about bad sync
etc have their origin in old PC's which were too slow to manage the
job - and from people trying to use cheap soundcards and expect them to
work as well as the more expensive ones...
Check out my site for more info on my own PC - and my previous Falcon
system.

Hi Folks!
It's time for me to have a clearout :(
Here is what I have for sale

Atari MegaST4
4mb RAM
Keyboard & Mouse
Matrix Graphics Card (Untested - No Monitor)
External 60mb Hard Drive
SM124 Monitor
SC1224 Monitor
ï¿½Offers (Buyer Collects)

Atari TT030
2mb ST RAM
8mb TT RAM
800mb Hard Drive + Spare Original 40mb
Keyboard & Mouse
ï¿½Offers (Will Post But If Collected I Will Include A Free SVGA Monitor)

I am located in Lancashire, near Preston if you wish to collect

Cheers,
Dave

PS. Anybody got an SM144 for sale?

It's a colour VGA card. I don't know much about it, IIRC it's based
around an Intel chip. If you have the drivers you can connect a normal
[S]VGA monitor.

Hi or should I say woof,

I use a C-Lab MkX Falcon for all audio work, running Cubase Audio Falcon to do the recording and the CDRecorder suite for burning CDs. The C-Lab is a special falcon with upgraded audio input and output circuits and a large 2.1 SCSI HD. An ordinary Falcon is just as good if you do not plan running CAF. I have produced a 10 track audio CD, with no problems, of pro quality and sold 10 in one night. The basic Falcon has everything built in MIDI etc, with no timing problems. All you get with a PC is Cubase VST or CAF with colour, big deal, and a load of compatibility and timing problems.

Summerize: Look for a C-Lab MkX with CAF or basic Falcon if not CAF.

Bob King.

> ->** Jo Even Skarstein http://home.nvg.org/~joska/

I never asked people to send me money for CT60 !!
I asked people to tell me if they would buy or not a CT60 !!
That's a bit different non ??!

After the delay having at least 100 POTENTIAL buyers, I will have to ask
these guys to confirm they still REALLY buyer by sending me a cheque !
Sure, I will not use the cheques and will send back the cheque if someone
don't want still to wait....
Finally the cheques will be used (put at my bank !) WHEN and only WHEN the
CT60 is ready and sent !!

People that know me, know that I'm honnest and never used a cheque without
sending the goods !!
It is not the case for some fucking companies !! Should I name them ?

Yes ... just to expose the otherwise painfully obvious fact that you
are a troll and are therefore interested in nothing more than stirring
up some shit for your own personal jollies. Anyone with more than two
or three actively firing neurons is capable of coming to the
conclusion that if they don't like a particular machine, they need not
visit its newsgroup, must less express some random thought (one of few
that get through the concrete of the average troll's skull) about how
crap it was. It is a well known fact however that trolls have no
actively firing neurons, due probably do the fact that their brains
have long since turned to gruel from years of Pokemon, Britney Spears,
and masturbating to National Geographic.

So, once again, I repeat:

Troll...

Because they had the best games!

On a feature by feature comparason, you'd have to take the '64 over the Speccy, but when you play the games the Speccy wins every time. It was the same with the ST. Comparing the features, you'd gave to go for the Amiga, but I much prefered the Games on the ST....

Anybody can say this (please note that I'm not saying that you are a crook), and it would be foolish for a normal consumer to trust complete strangers with their money based simply on this.

I fully understand that you want to minimize your risk, especially with so few potential buyers. But this is capitalism - as the manufacturer/seller, *you* take the risk, not the customer. Normally you research your market (which you've done), calculate the risk and manufacture your product if the risk is acceptable. Most people think this way, even Atari consumers. You can ask for cheques up front, but I doubt that enough people will commit. As a single consumer in a different country I can't do sh*t if I get ripped off. I know this from experience.

Since I bought my Afterburner in 1997 (from Titan, it arrived after just fice days. Cheap too!) I have only had problems when buying stuff for my Ataris (from shops and dealers that is). I've lost enough money to finance a complete PC, I've received defect hardware, support has been non-existant and delivery has been unstable (to put it mildly). Atari-items tends to get lost in the mail a lot more frequent than other gods, especially when it's pre-paid. Can you blame me for being slightly bitter?

> People that know me, know that I'm honnest and never used a cheque without
> sending the goods !!

Well, I don't know you, except from usenet and a few private emails...

> It is not the case for some fucking companies !! Should I name them ?

...and the impression is not that good. Sorry, but that's how it is. You might want to moderate your language.

You, sir, are no fun. Your concept of what constitutes humour is painfully stupid. While an annual flamewar with comp.sys.cbm could be considered an amusing tradition, what you are doing is trolling. You are not being daring and you are not pushing the boundaries of accepted comedy. You are wasting your valuable time. Go away, grow up a bit, and then come back.

I have one of those boards installed in my STFM (which is no longer in
use). I'd describe the fitting as somewhat tricky, and ideally needing
the ST to be recased (mine is in a Lighthouse Tower case).

English docs etc for the Aixit board are available on my web site in the
MISC section.

If anyone in the UK wants to buy this ST from me then drop me a line for
further details.

I quite agree. The Atari ST was much better than the Spectrum, due to it
being 16-bit. However, if Lister was someone crossposting from
comp.sys.amiga, then it would be true, coz compared to the Amiga, the Atari
was cr.... you know what? I'm just going to leave now. Oh, someone has
already retreived my coat... and urinated in the pockets. Oh, gee thanks.

The images are okay, but they have their own filesystem without FAT and
directory and with excuteable bootsector. Maybe it works for you if you
pre-format the disks with 80 tracks, 10 sectors and 2 sides.
(This is for the two files wings2.st and wings3.st with 819200 bytes)

Peter

Looks like somebody had trouble to read some messages.. :/

Iï¿½m one out of the buyers list. Nobody ask me anytime for money or tell
me i have to send cheque or any money order!

I was happy if someone use the time that was waste to answer some stupid
messages to write any good software and put it to any webside for smal
money.. That supports this market.

> It is not the case for some fucking companies !! Should I name them ?

Yeah :-> I know what you mean :->
Otherside, Rodolphe was the last that take money for nothing.

Someone should ask him what he takes from people they canï¿½t fit CT2
well.. Post an package only. THATs called SERVICE!

Maybee some other "commercials" should cut an part of..

Sorry for that bullshit english, canï¿½t found correct words.

Regards, Robert

The TT VME bus has no bus arbitration, so putting a CPU on a TT VME card
will not work (at least not to replace the TT's 030).

Thats the address I tried the other night and all I could get was the
web site of the people who make the TT memory board (are they the ones
hosting the Calamus pages?). Any way I tried it again a couple of
minutes ago and it came up correctly. I know it was not a problem with
CAB as I tried on a PC with NetScape and had the same problem.

Thanks

You mean the connector only, without a PCB? It is a standard female DIN
VG-96 connector, should be available at any good electronics parts supplier.

Hi Steve

I probably made a mistake, but the Manual is there. I'll check. There's the
main one for SL 91 and an Addendum for SL 96. Useful of course for those of
us with the Calamus Demos, saves having to guese the meaning of all that
german.

Hi again Steve,

just checked, funnyly enough the manuals are at the URL:

http://www.calamus.net/us/calamus/manuals.html

The main PDF is 6.63Megs

Bob.

Hi Galen,

A>Because of the limited serial port, there is no point to having a modem
A>over 19.2 (that is, a 28.8K modem). These are found very cheaply on
A>the used market.
you should not confuse the computer<->modem speed with that between
modems. The latter one should exceed of course the first one (because
of compressed transmission and modem buffers) but there's no need to
buy a modem with more than twice the computer<->modem speed.

The serial port of a usual ST may easily be accelerated by a quick and
cheap modification upto (fixed) 38k4.

But as my TT is IMHO too slow for browsing, I'd suggest to stick to
email and refrain from surfing the web with any ST.

That's interesting. I get the home page of Calamus when I
use that address. And on a PC with Netscape 4.73. With
that in mind:

The above address has frames. Try
http://www.calamus.net/us/welcome.html and see what
happens. That simply brings up the info contained in one of
the frames when you see when you use index.htm.

You can also try http://www.calamus.net/us/forum/ and see
what happens. That is the location of the English Calamus
discussion forum. I check it every couple of days. Not
very active, but the URL works.

Ken

3501. And now, PC vs Falcon, round 3...

Newsgroup: comp.sys.atari.st
Date: 2000-10-03 00:00:00 UTC
From: Puppy Dawg <swallow@intergate.bc.ca>
Message-ID: <39dad321@newsserver1.intergate.ca>
Source record: 56755

Hi again.

First off, I'd like to thank all of you for your help and understanding. You guys have been great! :)

But its not over yet... (insane laughter)

Before I begin, I would like to apologize for sometimes going off topic. I realize that this is an Atari newsgroup, but I do need to refer to the Dark Side (Wintel boxes) once in a while... It's not my fault, really. I blame society. :)

Ok, and onto round 3 of "Puppy Dawg's Battle Royale". The score (approx.) is: Falcon 7, PC 4.

First off, to clarify the hardware comments. Yes, I do realize that hardware can burn out on any machine. I still find it strange that my 1040ST and my 65XE (Can't get rid of that little guy...) are still running strong, while my PC is killing itself. Most of the components are not cheap junk. (actually, the lowest quality parts have had no problems... go figure, eh?)

Now, many of you have been talking about the higher end features on a PC. Yes, all these extended features are great, but the fact remains: I'm just starting here. I'm looking for something reliable and semi portible. (trust me, after a full size PC case, almost anything else is portable...). From what I've learned from these postings, the Falcon should still have enough features and toys to keep me busy for the next while here. Remember: I'm not looking for top of the line, but just decent to good.

Got some more questions for y'all.

1) Is there a LAN adapter for the Falcon? I remember someone working on one for an ST, but don't remember much else about it. I'm talking 10/100 BT connection here... Would make transfering data much easier.

2) I've been getting conflicting reports about SVGA compatibility. Do I just need an adapter, and then I can use all Falcon resolutions on a SVGA monitor?

3) One reason I want to remain on an Atari is the "retro" sounds it can produce. I'm assuming I can reproduce this on modern equipment, but the older stuff still has a nicer tone to it. (Don't ask, I have strange tastes... ;)) Does the Falcon still retain the older style of voice, such as the original ST? (or, at least the capability... am I making any sense here?)

4) Drive capacity. What is the max drive size / partition size supported? I remember seeing 2gigs listed for *some* computer, but it might've been an *cough* amiga *cough*

5) Hardware emulation. Do they make a Falcon-on-a-board for the PC? (hey, it could happen!) What ever happened to the PC emulators for the Falcon? Where they ever any good? Could I kill two birds with one stone in this manner?

Also, it's sort of a repeated question, but does anyone have (or know of anyone) with a Falcon for sale on the west coast? (preferably around Vancouver BC / Seattle WA.) Cheap is good... I have other stuff that someone might one (600XL, some ST stuff, SMS, VCS, 2600, I can let go of my genesis if the price is right...someone must want some of this jun....errr... precious treasure...)

Anyways, that's it from me for tonight. Once again, I really appreciate the help and advice you've been providing me. Thats why I like Ataris: the people are actually proud to own one.

Puppy Dawg

> My quibbles with my PC:
> - HW reqs keep climbing too fast.

Not as long as you don't upgrade the software...

> - SW doesn't always work when it says it will

Indeed. My experiences with Win98 and "multimedia" of any kind is that it's not very reliable. The most common problem I've had is conflicts between drivers, every time I install new hardware or OS-components I have to fix a lot of problems with older hardware that used to work perfectly well. It's very annoying, since I only want to *use* that PC and not play around with hidden features and secrets in the OS.

> - This damn HW keeps dying on me. I've had to send back a hard drive

This is also very common, low-end PC hardware is quite often of very poor quality. I've had my share of dead hardware, e.g. I once had an AOpen motherboard which set the AGP-cards on fire (yes, the graphics-card actually started to burn - twice).

> - This damned OS. I cannot stand Windows. Switch to linux, you say?
> Right. I have a hard enough time getting devices to work when they
have
> full driver support...

Not only that, but there's very little useful software for Linux, unless you want to buy really expensive workstation-stuff.

> - MIDI has never worked quite right. (now the drivers have

My limited experience with MIDI on the PC is that it depends heavily on the hardware. It's possible that ordinary Soundblaster-cards can be used, but most serious MIDI-users tends to buy rather expensive stuff.

> Ok, now where was I? Ah yes, the Falcon. Is it worth me finding a
Falcon?

I'd say that you should find yourself a cheap, second-hand Falcon for the MIDI-stuff, and use the PC for recording. The Falcon is fine for recording too, but a PC will be much more flexible and powerful. You should probably replace your soundcard though.

> I would like to continue to use an Atari, but I know my STf is not up
to the

> task. Would i be better off getting a "fully loaded" STE, and then plunking
> the rest of the money into a PC?

For plain MIDI I'd say that a 4Mb ST or STE with a harddrive (perhaps a Zip, so you can easily transfer your stuff between the PC and Atari) would do very well. But a Falcon is faster and more comfortable, and quite cheap too. I wouldn't be surprised if a 4Mb Falcon with a built-in 65Mb harddrive (IIRC the standard configuration when it was launched almost a decade ago) turns out cheaper than a hot-rodded ST. I wouldn't spend more than USD200-250 on a plain Falcon in good condition.

I agree. I've had a 144 myself, and while it's bigger and looks a bit
better, it's not nearly as crisp and flicker-free as my SM124.

Do not cross to the Dark Side, young Puppy Dawg. I have a page at
http://56030.atari.org which gives a pretty fair reflection of the
Falcon. And yes, Falcamp works well for 90% of MP3s on an unaccelerated
Falcon. The only problem is realaudio files, Aniplayer is limited to 14K
ones AFAIK.

Puppy Dawg wrote:

Once upon a time <39d7c27d@naylor.cs.rmit.edu.au>,
Amiga2000@bigpond.nospam.com grabbed chalk and scrawled:
>
>
>http://cgi.ebay.com.au
>
>Rare diskless atari (no floppy only HD port/lots of ram)

Description:
Rare Diskless Atari
(In otherwords - common as muck early 520ST)

This rare Atari computer is similar to the 520 st, only it was not made
with the internal disk drive.
(I'm a moron, and found this computer without knowing that the first
Atari ST models /didn't have disk drives/ and it's lacking the fairly
essential external drive so rather than working out what it /really/ is,
I made up some bullshit)

These 68k based workstations where intended for use
with external peripherals (networks/HD's/etc).
(This is despite the fact that there is an /external/ floppy port, there
were no proper Atari networks marketed, and the HDs weren't introduced
until some time after)

Unit shows some yellowing but is otherwise is excellant condintion.
(It's a typical Atari. I swapped my dictionary for it).

Includes power supply.
(So I knew it powered up, and being an Amiga owner, I assumed that
having the whole OS in ROM meant it was something special).

The bid is $40 Australian. So it's not real money anyway.

I hate eBay ;)

Hi Lyndon!

I have German PD program HOW_FAST which plots write and read speeds independently as the file-size increases. Unfortunately it is all in German, but if you want I can send it to you - it's only 44 kB uncompressed. On my IBM internal IDE with a Nemesis at high this shows read and write speeds rising up to 1400 Kb/sec with larger files (around 200 Kb).

New section, The Atari Photo Album. Wouldnt it be nice to see the face of the programmer who created that program you use every day ? Or to put a face to the person you engage in discussions with on an Atari newsgroup? I ask all active Atari users, programmers, and webmasters to please submit their picture, in either jpeg,gif, or png , to be added to the new page.

E-Mail web-ready (Jpeg/Gif/PNG, properly cropped etc) photo's, including your full name (And system setup if desired) to bengy@mac.com

PS MagiC Online is active again.

Take Care,
Bengy

I'm afraid it is :-(Both the CT2 and Afterburner causes DMA-problems in
the sense that most programs that use DMA does so directly in hardware and
by ignoring the fastram-buffer (after all, there's no fastram on a
standard Falcon so why bother...). You can work around it, but that often
means that you can't run the CPU at full speed (no copyback on the AB) and
that you can't use the fastram.

Then there's also a small DSP-problem with the CT2. It can also be
patched, but as far as I've been told, this doesn't solve the problem
completely. I must admit that I've long gone forgotten what the problem
actually *is*, something interrupt-related IIRC.

The only software I know that's fully compatible with these accelerators
is the Softjee-stuff. Cubase Audio also works with the Afterburner, but
not flawlessy I think.

The Stacy doesn't use parity, but you can use SIMMs/SIPPs with parity.

> Does anyone have suggestions where to find the SIPPs. Ive tried local
> but, nothing.

SIPPs are hard to find, it's probably easier to solder pins or wires on a
normal 30-pin 1Mb SIMM. I've done this in my Stacy and it works fine.

Hi!

I've just managed 1100kb/s read on my HD, using IDEal interface on an
unaccelerated STE. (not bad me thinks)
CDROM (48x Atapi) only managed 300k, which is quite strange. I would
have thought it would have been about the same as the HD.

I would like to know what the results are using a CT2 and Mario's IDE
card.

BTW How_fast is an excellent piece of software. Old ('93) but very
smart.

OK, I see. I haven't studied the PCB in my Falcon for quite some time.

I'll just have to try :-) I just checked with ELFA, the connector is quite
cheap so it won't cost much except an hour with a soldering iron...

3525. i-monitor for the ST? (funny yet a serious question)

Newsgroup: comp.sys.atari.st
Date: 2000-10-04 00:00:00 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <0000.39db7aac@fmlynet.org>
Source record: 56648

FamilyNet HQ: Telnet:\\www.family-bbs.net

Hey folks,

You know there are two facts that are coming to light....

1) CAB on a 1040 ST at ST-LOW produces some colorful graphics! Just HUGE!
(Due to resolution)

2) ST (color) monitors are practically given away.

So what I was thinking of was to stack about 4, 6, or 8 of these side by
side and surf in ST-LOW! Take about increased monitor size and colors! And
you won't have to worry about having to hit the scrollbar all that often
because you'll have the monitor space to match the resolution!

You know what I'm talking about right? Macintosh has a system where you
can have multiple monitors side by side as one monitor.

If any one has anymore questions, let me know.

Probably a bit too expensive when I don't even know if the cards will work
together (possible address- and interrupt-conflicts)...

> adapter itself. You see to add that adapter I let someone rebuild my TT
> into a tower. So there might be some damage somewhere.

What? You let *someone else* mess around with your TT? It's a lot more fun
(and probably a lot cheaper) to do this yourself ;-)

> kindly has giving me a new design adapter which should work, at least it
> works with nova cards/Riebl but he isn't sure if that story goes for the
> Crazy Dots aswell. For the moment I haven't found the time to try the new

I found one guy (Michael Ruge) who use a Pam's ethernet card and a Matrix
graphics card together, but that's all. I guess I'll just have to try it.

You could try sending it to PDF2TXT@adobe.com, MIME encoded as an
attachment. They'll convert it to you in quite a quick time. It only
converts to ASCII, so pictures etc will be lost.

Why not? Isn't that what the port was intended for? IIRC, it's identical to
Mac ports, and the Localtalk Apple is a LAN running on high-speed serial
ports.

There was definitely someone who was 'involved' with the Amiga who
went to work on the ST, or vice versa. I just can't remember who. Or
what. Or anything which happened before today.

Hi Lyndon,

as far as I can remember no fonts were loaded in for the Calamus manual, which indicates that it was a scanned it bit map job, ie nothing but pictures. Hope i'm wrong because what you describe sounds a very useful service.

Bob

Perhaps they shoud have called it the C256? I was once tempted to but an
Amiga, but the ST was £100 cheaper, so guess which one I bought.

At last someone that actually knows something!

How ironic is this? When Tramiel left Commodore he took a number of
Commodore engineers with him, so as it turns out commodore (and atari?)
engineers designed the "Atari" ST! LOL.

Also when you people can't defend the ST, bring the Amiga into thread
and bash it huh...? Must be comp.sys.atari.st's SOP.
I have both machines and the Amiga is better, sorry that just my
opinion, but the ST isn't shite (just not as good).

Bill

3541. symbol font Logic 2.5 (music)

Newsgroup: comp.sys.atari.st
Date: 2000-10-04 00:00:00 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <39dbef73$0$62623$726baab@news.execpc.com>
Source record: 56664

Hello,

I was working on a piece of music in score edit mode.
I can't explain the details right now,
but somehow figured out how to use the symbol font
like text.
When using the symbol font, music symbols are assigned to
certain "keys" on the computer.
For example: Shift K would yield || (thin, thin - double bar)

I took the time to figure out all of the music symbols assigned
to the computer keyboard. (Without Shift key and with Shift key)
The music symbols are somewhat limited. Couldn't find clefs, for
instance.

I made a rough hand sketch.
Scanned it in with STScan and saved it as a .IMG file.

Question:

If I attached the .IMG file to an email message, how would one
view this type of file.
(New at this sort of thing)

Would anyone have an interest in this hand made sketch?

The sketch is simple, like a quick reference guide.
I don't think there was one in the manual.
But if one wanted to key in a quick musical symbol, it
would save the time of "plunking" through a bunch of keys.

ken

Hi all.

From the ongoing thread that I started a while ago, I have decided that I should at least drop a line to see if anyone has a Falcon they might be willing to part with. Cash sale would be viable. I also have various jun... errr... stuff (ST, SMS, VCS, 2600, XL, 32X, Colecovision, etc) that I am willing to trade if anyone is interested, or a a combination of cash and hardware.

I'm in Vancouver, BC, and would like to see a seller from around here (or Seattle area, either work for me.) as it means that I don't get ripped off, and the seller doesn't have to worry about being ripped off, and I don't have to pay shipping. So I'm paranoid... but I think they *are* after me...

Anyways, I'd like to see if there is anyone that can be of asistance here.

Thanks for all your help and patience.

Puppy Dawg

>TOS compatible partition is 1 GByte.

I have MagiC 6.01 and HDDriver 7.71 - going back to an earlier thread, I'm trying to use a 4Gbyte SCSI drive with my Falcon. Best I can do is two partitions of 2Gbyte each, but I'd like to have one single partition of 4Gbyte. I can't find a partitioning scheme that will allow this, is it actually possible? I'd prefer it to be compatible with FAT32 on the PC.

No, I mean the complete PCB. Unless I can just hook up a single
connector in parallel then, do you know if that's possible? I'm going
to try to connect both a Crazy Dots II and either a Pams or Riebl
ethernet card to my TT.

Hi

Are you saying that your Atari have packed up or just crashed!

If it's just crashed, you can use a program to put the MS-DOS bits
that's needed on for the PC to read it. I use, yes you've guessed it, DC
Format 3.0.

The program allows formatting of disks but you can just select the MS-
DOS/IBM selection and it will do just that.

the file can be downloaded at the following address:

They weren't funded by Atari, they were their own separate company
who, in their early days had developed a few games for the VCS.
(Mogul Maniac, for example) They developed the Amiga but didn't have
the resources to market it, so initially approached Atari who wanted
nothing to do with it. They then shopped it over to Commodore, and
the rest is history.

Actually, the TOS-DOS partion is slightly under 1.5, It is something
like
1.46GB. TOS can read the SyJet, as can MiNT-n.aes w/Thing. It is MagiC
that can't read it!? Is there any reason you can think of for that?

> > another puzzle. I would have thought Kobold disk handling would be more

I don't understand what you are saying. It seems to be the opposite of
what I am saying! :-) I am saying that since my operating system _can_
access
the Syjet cart, why can't Kobold?
I can access it under TOS, and MiNT, Why can't Kobold? Perhaps Kobold
can't
handle the sector size?
I don't know, I don't understand this whole problem!! :-)

> >view my TOS-DOS SyJet(1.5GB) cartridge?
> Magic does not like ICD partition info, what HD-driver software are you using. You
> need AHDI compatability for Magic.

I am running a CT2b Falcon, TOS 7, HDdriver 7.71
Uwe says that TOS can't handle partitions over 1GB,
yet when I partition the cart in HDutil, it says that only TOS4, Magic,
or BigDOS
will be able to handle the partition size. I don't know about BigDOS,
but TOS can
handle it, but MagiC can't. like I said - weird!
Kobold 2.5 can't handle it either, so I use Things or TOS's file
copying.

Once upon a time <XnFC5.3153$d4.186403@nnrp4.clara.net>, neuro
<neuro@well.egg.chips.beans.spam> grabbed chalk and scrawled:

>The Atari connection probably comes from the Amiga team leaving Commodore to
>develop the Lynx ...

How many versions of this story are there?

Blokes responsible for 400/800 architecture form Amiga, Inc. and work on
Lorraine, the computer that became the Amiga. Atari /were/ going to use
it, but didn't want to pay the asking price (Tramiel's tight fists), so
Amiga, Inc. offered Lorraine to CBM - who took it on. Atari developed
the ST, which really is a simple system and has nothing tying it to the
earlier platforms. The ST is essentially a 68000-based CP/M computer
with a graphical front end and fairly basic graphics and sound - but for
the time, decent I/O including MIDI.

Some Amiga designers joined games firm Epyx, who were working on a new
platform - which was the Lynx, which Atari bought when Epyx ran into
trouble.

There's also a link with Epyx in the Flair system, which became the
Panther (unreleased 32-bit system, some Falcon architecture was derived
from it) and Jaguar.

Sources: All over the web, and stuck in my head. Inaccuracies are
inevitable ;)

Hi Ji,

It does, at least on my Falcon and Milan, on the latter each page takes about 15 secs. In this case, there are no fonts involved the whole thing is bitmapped. In practice Ghostscript is too slow for PDF even with a Milan and is stumped by faulty code, eg it refuses to display the DA's LayoutTC Manual. I have to resort to Adobe Acrobat, they invented PDF so have the best decoder, eg with the Layout manual the errors were recognised and corrected on the run.

Bob.

Hi Ken,

Sorry, but the reason we use the CGI-script is not because we want to be fancy.
We use it only to be able to count the number of downloads (as I've said before).
For some reason CAB doesn't seem to be able to handle forms correctly (at least
not earlier versions of CAB). If you have problem downloading a file, just send us
an email and we'll send you the requested file by email. This information is also
available on the homepage.

http://nb.atari.org

Take care,
Daniel Hedberg

It's the sort of thing you might find in an industrial computer
supplies catalogue...VMS bus-extension card....you might have to settle
for four or five extra slots though....

Alternately you coudl settle in for the most boring weekend of all time
with a few wire-wrap DIN96 plugs and sockets and a mini soldering
iron....and a lot of patience...

What else would you do with the second PCB? You just need to connect both connectors in parallel - this is more a mechanical (and wiring) than an electrical problem.

However, since the TT's VME bus is no real VME bus that conforms to the spec, hooking up more than one card may cause problems due to increased loading on the signals - however, I know that this has been done successfully multiple times, but it may depend on the cards.

For this purpose AG Computertechnic sells one-to-two VME bus adapter. I've an early version adapter installed in my TT030 but it doesn't work.:-(. There is a possibility however that this has nothing to do with the adapter itself. You see to add that adapter I let someone rebuild my TT into a tower. So there might be some damage somewhere.

According to Axel the first version of that adapter wasn't good. He kindly has giving me a new design adapter which should work, at least it works with nova cards/Riebl but he isn't sure if that story goes for the Crazy Dots aswell. For the moment I haven't found the time to try the new adapter out. I hope I will be able to do this this weekend.

> to do what was required.

This is actually an off-topic question in this group - but since I have much experience from both systems, both as a user and as a technician, I'll try to make some important remarks...

> My quibbles with my PC:
> - HW reqs keep climbing too fast.

That's true. As the hardware gets faster, the programmers can make more of their ideas real - which in it's turn requires even more computer power. It's a never-ending story - but if you're satisfied with the perfomance you have, you don't need to upgrade the software and loose speed because of it.

> - SW doesn't always work when it says it will

If you do things the right way and don't mess around with your system too much, you won't have any problems.
The only (!) time I've had any problems with my PC (which has been running Win98 for two years now, with a heavy load of composing and recording with Cubase VST - as well as installing and de-installing games etc...), was when a harddisk died on me. A harddisk crash can happen regardless of which computer you use.

> - This damn HW keeps dying on me. I've had to send back a hard drive again,
> and my scsi/video capture board has been tossed, as it was crashing the
> computer ever 10 minutes. So, now, that $300 CD burner is now just taking
> up a drive bay...grumble....

As I said above - equipment does break both on Ataris and PC's...

> - This damned OS. I cannot stand Windows. Switch to linux, you say?
> Right. I have a hard enough time getting devices to work when they have
> full driver support...

Don't even think of anything but Windows if you want to do serious studio work. Not even NT is a useful OS since the midi handling and timing issues are different :(

> - MIDI has never worked quite right. (now the drivers have disapeared, and
> I haven't had the time to reinstall, so there is now *no* MIDI support....)

>
> Granted, my PC has an utter load of crap sound card (SB PCI 128. It's never
> been great.), but it should be fast enough to run a bloody midi sequencer!

Nope! Keep as far away from SoundBlaster as you can if you plan to do any midi work. Those d**ned cards aren't good for anything but playing games (well, all the cheap "SoundBlaster compatible" cards are crappy and are in fact one of the main reasons why people still believe in the myth that PC's are bad for making music). They're nothing but toys and have extremely poor midi handling. Get an RME soundcard and you'll be in business - oh, and don't forget an external midi interface that connects to a port.

> I do not consider 300 mhz w/ 64 megs ram to be too slow for that task. I
> know this is an Atari newsgroup, but since many of you are musicians, would
> any of you have suggestions/ideas on this?

For use with VST? Use at least 128MB RAM - otherwise you won't get the best possible performance out of the system. I run with 256MB RAM... You should also use two harddisks - one for the system, programs etc, and one separate only for audio. 300MHz should do nicely for most users, but if you start loading the system with lots of plugins and software synths, you'd need a faster machine...

> Ok, now where was I? Ah yes, the Falcon. Is it worth me finding a Falcon?
> I would like to continue to use an Atari, but I know my STf is not up to the
> task. Would i be better off getting a "fully loaded" STE, and then plunking
> the rest of the money into a PC?

Ouch! That sounds terrible. You'll need two monitors and you have to save the songs on two different computers every time. Not a good idea if you ask me. Stick with the Falcon or the PC - so you'll have everything

available on the same computer at all times. It'll save you a lot of confusion...

> I'm putting that out to you guys, because I think that you can give me an
> unbiased opinion (I mean, seriously, look! no Amiga anywhere! :)). Hope
> someone can help me... ("help me Atari-Wan, you are my only hope...")

I've used a Falcon system for many years and it's served me well - but to compare it with a PC system really isn't worth your while, since the difference is huge! The Falcon's latency when recording audio is MUCH higher than my PC. I have sample-accurate audio and midi at all times on my PC, something that the Falcon (or any other Atari for that matter) doesn't have. Ataris are very good for midi, but the sync is actually worse than a PC system with a good midi interface. On the PC you still have development of the hardware and software - and we all know what's happened to the Atari market :(The Falcon has a maximum of 8 mono audio tracks in full DAT quality, while I can play over 50 mono audio tracks at once on my PC system - and I'm still nowhere near an overflow. In VST you can use plugin effects of very good quality, both as insert effects and as effects sends - while the built-in effects in CAF are of rather poor quality and can't be exchanged. Some people claim that the only thing gained from changing from Atari to the PC platform, is that there's a color screen, but that's extremely far from the truth. Everything's better on a PC - and I can say that without any doubt, even though I still have a soft spot for Atari machines. I've saved one Falcon, which I'll never let go for nostalgic reasons, but after using VST on my PC for a while, I realised that I'll probably never use the Falcon again...
Now, there are probably people ready to lynch me for saying the forbidden thing; that something is better than Atari - but I really don't care. All the people who already have changed to the PC platform are evidence enough, as well as my personal experience.
If you can get your hands on a used Falcon and don't need top performance, I'd say that it would probably be enough - but the add-ons for making it really good are actually rather expensive due to the small market, so try to get a complete system that's been used with CAF. If you go for a PC solution, you'll probably have to pay more - but on the other hand, you'll get a much better system.

CAF does work, also the SoundPool Software. They both work better with
ver 4.xx of the toolkit for the Afterburner. Now is it flawless.....no
but it's about as stable as it was on a standard Falcon. Of course CAF
cannot be run from FastRam etc....

Got to agree with Bob, I fix PC's for a livng and as far as robust hard ware goes they suck bad. Mostly due to the fact that thay are churned out before they are ready to compete with everyone else. My Falcon can still hold it's own for what I use it for, yes it is old technology, but who cares. After all would you chuck out a 1972 E-type Jag just because it is old?

I'm mainly using Soundpool Audiomaster and it works without
problems on my CT2B Falcon.

Couldn't the supposedly increased flicker be due to the increased distance the rasterbeam has to move in one sweep?

I saw a VME extender for the TT which added some VME slots in an external case
on eBay some days ago, if that could be of interest.

Well - I've had harddisk crashes with both my Falcon and my PC, so
there's no difference...
However, it really is amazing that Atari machines in general do tend to
just work and work - maybe they were built with some quality thinking in
spite of the low prices? :)

> Now, many of you have been talking about the higher end features on a
PC.

Remember:
> I'm not looking for top of the line, but just decent to good.

I'd say that the Falcon with Cubase Audio is actually enough for most
"normal" musicians - but when it comes to top performance, you need a
PC. I wouldn't go for a Mac because of their relativiely small market
share, since I've been on one loosing team once and don't want that
repeated with vanishing hardware and software support... :(

on one
> for an ST, but don't remember much else about it. I'm talking 10/100
BT
> connection here... Would make transfering data much easier.

There is a LAN connector, but I've never even tried to use it, so I
leave it to someone else to explain about it...

> 2) I've been getting conflicting reports about SVGA compatibility. Do
I
> just need an adapter, and then I can use all Falcon resolutions on a
SVGA
> monitor?

Any SVGA will do - but you always need an adapter. There are some strange interlaced resolutions which can only be seen on a TV or on an RGB monitor (SC1228 - with another adapter), but I wouldn't bother with that since all programs - except for a lot of demos and some games - work with the VGA monitor.

> 3) One reason I want to remain on an Atari is the "retro" sounds it

such
> as the original ST? (or, at least the capability... am I making any
sense
> here?)

The terrible sound of the ST? Hmmmm - did you consider therapy...? ;)
The sound system has been altered somewhat, but the built-in sound can probably be compared to the STe - correct me if I'm wrong (never used it for anything but the click in CAF)...

> 4) Drive capacity. What is the max drive size / partition size
supported?
> I remember seeing 2gigs listed for *some* computer, but it might've
been an
> *cough* amiga *cough*

I'm not quite sure about that. Uwe Seimet is probably the man to ask.
You can't use partitions larger than 1GB, but I never got 1GB to work completely stable with CAF when I tried - it had to stay somewhere around 700MB or so - otherwise CAF seemed to get confused (CAF only uses part of the harddisk driver - and has special routines for the harddisk handling...).
As for harddisk size, I don't really know. I tried a 9GB SCSI, but it wouldn't work properly. I've used several 4GB SCSI (both SCSI-2 and SCSI wide) without any problems. Maybe someone has some more info?
Use HDDriver and nothing else - not ICD and certainly not AHDI! Just about everyone else uses HDDriver and it's worth a lot more than it costs, since it works so well - and it still gets rather frequent updates.

> 5) Hardware emulation. Do they make a Falcon-on-a-board for the PC?
(hey,
> it could happen!) What ever happened to the PC emulators for the
Falcon?
> Where they ever any good? Could I kill two birds with one stone in

this
> manner?

No way!
The Atari emulators for PC can't make use of any midi applications, so
that's a waste of money if you plan on using CAF.
The PC emulator that was around for some time was a 286-emulator. Try to
run Win98 on that one and you'll throw the computer out of your window
within 5 minutes...

And going back on topic to the Spectrum side of the cross post - Flair were the ex-Sinclair research people who developed the RAM Music Machine and RAM Print interface... after leaving Sinclair where they were working on the "Loki" project.... they then went on to develop the "Flare One" mega machine that never was, which then became the crucial component of the Konix Multi System... and then ended up getting tied up with Atari when that never happened....

Atari's do go wrong occasionally, it's one reason why I'm always
picking up manky 520's....strip the bits on some, upgrade some of the
others, trade them on or sell the bits to other enthusiasts adn make
sure I've always got enough spares for mine.....BUt that said, I thrash
all of my Atari's and they'bve been generally reliable...just had my
first HD failre on an Atari (my home Falcon) and it's a horror....still
haven't got the graphics card working, still not online....

> > 2) I've been getting conflicting reports about SVGA compatibility.
Do I
> > just need an adapter, and then I can use all Falcon resolutions on
a SVGA
> > monitor?
Get an SVGA and the adapter (every monitor needs an adapter cos Atari
used a 19-pin D-type for the video out....if you'r TV has a SCART input
I'll make you up a SCART cable....if I can find some 19-pin
connectors...

> > 3) One reason I want to remain on an Atari is the "retro" sounds

voice, such
> > as the original ST? (or, at least the capability... am I making any
sense
> > here?)
>
You aren't making sense to me I'm afraid.....For quality audio on the
Falcon it's essential that you get off-board AD/DA converters and a
44kHz clock(for CD). I use a Jam-Clock on my Studio Falcon and the
FAD2/2....very good sound, what comes out is what went in.

If you don't mind a bit of fiddling then you can fit the Phantom SE
accelerator as it comes with a 44kHz clock....

> > 4) Drive capacity. What is the max drive size / partition size
supported?
> > I remember seeing 2gigs listed for *some* computer, but it might've
been an
> > *cough* amiga *cough*
>

I'#ve got a 4Gb 3.5" IDE in mine (they do fit, just) split into
partitions around 650Mb (convenient for CDR backup) and I use
Audiotracker...it works well, takes over about 540Mb of each partition
it's enabled for (<Tape> files)....I use HD-Driver 7.75 IIRC, don't
even think about using anything else, it isn't worth it and don't try
to get a pirate copy from around here, no-one will ever talk to you
again, we all respect Uwe too much....

> > 5) Hardware emulation. Do they make a Falcon-on-a-board for the
PC? (hey,
> > it could happen!) What ever happened to the PC emulators for the
Falcon?
> > Where they ever any good? Could I kill two birds with one stone in
this
> > manner?
> If you got one of the 286 boards you could try one fo those <REV to
486> upgrades, then you'd hav e a machine that ran Windows like a
dog.....quite a lot like a PC in fact <g>......

MArio's about to come out with a SCSI-Ethernet converter, I think the
ideal set-up if you have space is STe 4Mb +NVDI + Cubase for
sequencing, Falcon with Audiotracker and some decent converters
(anything by Line Audio or SoundPool or JAM) plus a clock plus a big
IDE plus a SCSI CDR plus ethernet for Audio recording and a PC plus
ethernet for audio editing....don't trust it with anything timing real-
time critical....the PC OS is not in any way shape of form designed for
it, it normally manages OK by throwing lots of fast hardware at the
problem, but even so it isn't a real-time OS.......modern MIDI and
Audio cards make a big difference on the PC, but I'd suggest that if
you can't get both the PC and a Falcon get the Falcon and register
Squash-It and buy Zero-X....then you can do the editing in there....if
You can't get a Falcon then the next choise would be a Mac with
Digidesign Digi 001....baby ProTools to learn and a whole heap of bucks
to buy, but at least Digi have a reputaion to preserve ..,..

>have thought it would have been about the same as the HD.

The problem is that Atari connected the two halves of the data bus swapped
on the IDE bus. This does not matter on harddisks, since the data is written
and read in swapped format (however, beware when accessing such disks on a
PC!).

However, on ATAPI devices, the byte order is defined by the device, so the
driver has to swap the data when reading, and this takes some time
(depending on CPU performance).

There will be an Atari presence (quite a big one by the looks of it) at the AMS show this November, at Bingley. I'm definitely having a stand there, and I'll be taking one of the Maggie team with me, so they're there too.....Joe Connor (ex of Atari COmputing) works (sometimes) for Sharward Enterprises, who organise the AMS, and is making sure that the Atari dealers get decent rates adn are all roughly grouped together so that we can shout abuse and throw thigs at each other without it affecting/offending the rest of the Show...until we gang up to throw things at the Sinvclair QL stand and those wierdo's with the Einsteins....

From previsou experience it's also a great place to pick up smallish hard-drives, CDROM's etc quite cheaply, as well as having a lot of the more mainstream PC rubbish there is a very strong retro-computing presence...as well as a load of electronics stuff that I can never resist...

3605. Re: Repost: NG Server or Newsie Problem

Newsgroup: comp.sys.atari.st
Date: 2000-10-05 00:00:00 UTC
From: swampfox1@earthlink.net
Message-ID: <kP4D5.3920$cV2.106348@newsread1.prod.itd.earthlink.net>
Source record: 56608

Again, I can't seem to duplicate the problem in ANY other NG!
And it's now up to 17 (from 7 a week ago) repeated posts on the list.
Highlight one and all 17 get highlighted.
If I de-select "Create Thread" and select "Collapse Thread" the problem
disappears but with the loss of grouping of same-subject posts!
Re-select "Create Thread" and the problem returns!

In case John R. is watching:
I've tried totally deleting and replacing the PRG, RSC, Killfile, XOVER,
UUD, and Munpack; deleting Log, Mailtest and Newstest letting Newsie
re-create those itself; changing the # of files to show and other
settings but nothing changes.

3613. Update to the translation project

Newsgroup: comp.sys.atari.st
Date: 2000-10-05 00:00:00 UTC
From: pap3@dana.ucc.nau.edu
Message-ID: <8rh3g3$2f3$11@usenet.nau.edu>
Source record: 56683

Hello,

Just a brief update on the Westfront PC translation project to the following systems:

o - Macintosh (68k)
o - Unix/Linux
o - Apple II/IIe
o - TRS-80
o - Tandy 1000
o - Sinclair ZX Spectrum
o - Atari 400/800
o - TI 99/4A
o - Coleco ADAM
o - DEC Rainbow
o - Amstrad

There are others planned; CP/M, in particular, would be a fine choice. For more information on planned releases, go here:

http://www.geocities.com/dunric/westfront.html

The source for translation is here:

http://www.geocities.com/dunric/wftrans.zip

From an older version, 7.00 dated November 4, 1999.

(You may need to copy and paste URLs into URL location bar of browser, as Geocities is picky about offsite download links)

I've been doing some research during the brief moments of free time I have on weekends, and have noticed a few things:

o - Most BASICs before 1978 had only minimal commands
o - Many BASICs were 8K (standard)
o - Most flavors of BASIC had A0-Z9 variables
o - Some didn't have string variables
0 - Most had access to RIGHT$,LEFT$,MID$ and STR$
o - Some used MATEAD Var%(x,y) for subscripted variables
o - Many machine specific statements such as COLOR, CLS and LOCATE did not appear until 1982 (IBM BASIC)

I also noticed some odd structure usages on some machines:

(Honeywell 600/6000)

940 LET X=L\LET Y=M\GOSUB 830

"\" is used in place of the now common ":" separator. Easy enough
to translate.

LET appears to be optional on later versions of BASIC (1978 onward).

I am also aware that file handling is machine specific, i.e.:

```
OPEN f$ FOR OUT AS 1
PRINT #1
CLOSE 1
```

Is an example of an older BASIC that printed output to a printer
or screen (but could also direct output, via special programming,
to a cassette player for tapes or a disk drive)

I looked at APPLE BASIC and noticed this weird usage:

```
D$=CHR$(4)
OPEN D$"DATA.DAT SREADFILE"
OPEN D$"DATA.DAT SWRITEFILE"
CLOSE D$"DATA.DAT"
```

Something like that, anyway (this is all from memory)

A final note is that some (most?) older BASICs before
Extended BASIC was introduced lacked IF/THEN/ELSE, DO/LOOP
and CASE statements.

So...

I am going to be making some assumptions about the BASIC
used, the speed, the monitor/television screen capabilities
and required STATEMEMTS:

Required:

DIM (must support integer _AND_ string variables!)
LET (optional)
REM
FOR/NEXT
TO
READ (MATREAD can be substituted if necessary)
DATA
PRINT (Obviously...)
INPUT (Obviously...)
IF
THEN
GOTO (or GO TO)
GOSUB (or GO SUB)
LEN
VAL
TAB

INT
RND
RESTORE
RANDOMIZE
ON (GOTO, GOSUB)
ABS
MID$
LEFT$
RIGHT$
STR$
CHR$

Not required, but helps

LOCATE (or clone)
CLS (or clone)
COLOR (* - Westfront PC was written in COLOR to differentiate it from other
text adventures that use only one color...Read: Boring!...If your
system does not support a feature of or equivalent, then we have
a problem...IF your system doesn't support color, then PLEASE
say it at least supports HIGHLIGHTING, UNDERLINING or BOLD...this
would be a decent alternative to non-COLOR supported systems)

(** - And 8 or 16 colors would be nice, too!)

If I've missed any, then please let me know at: dunric@yahoo.com

Memory Requirements

I'm going to try to squeeze as much as possible from WFPC into an 8K BASIC...
Yes, it's going to be hell trying to squeeze the first continent (1,014 rooms) of WFPC
(Overall: 1,572 rooms) into 8K, but there are ways around the variable usage (i.e. reading
in rooms from disk, tape, etc)

There are tons of empty rooms...they don't need to be included. The Frequently Asked
Questions
(F.A.Q.) anad Maps for Westfront PC are located here:

http://www.geocities.com/dunric/faqmap.zip

Just copy and paste into URL bar of browser.

So PLEASE have your system at least handle:
---

o - 500-1200 total lines of BASIC code (minimum)
o - IF/THEN/ELSE statements (so I can squeeze as much as possible into 8K)
o - Integer and string variables
o - Tape/Disk file commands, i.e. OPEN/CLOSE,PRINT#,INPUT#, etc.
o - 360KB of Disk space (You could use two disks if necessary)
o - At least 40 columns of text per line (It uses, or will use, line wrapping)

If you'll notice from this picture:

http://www.geocities.com/dunric/tavern.jpg

Color is VERY important to gameplay (room specific commands are highlighted in gray, directions
and other things in yellow, and rooms in white. I also like to use green and purple a lot (for
the inventory and other things).

Necessary commands:

Westfront PC is a text adventure.

Certain commands are necessary, some aren't:

I can make concessions on certain commands, i.e. when a player GETs an object, if it can be worn or wielded,
then the computer will automatically equip it for the player, without having to use WIELD, WEAR
or REMOVE commands. Same with DROP.

BUY and SELL are absolutely necessary. The player needs a way to purchase and sell items.
FIGHT (or an equivalent) is absolutely necessary. The player needs to gain experience points,
find new weapons and armor, and pass certain trials in the game.

OPEN and UNLOCK are necessary, but LOCK isn't. USE is necessary, and so is CLIMB.
LIGHT is necessary (e.g. LIGHT TORCH), but ENTER isn't.

SAY is semi-necessary; just adds to the game.
EXAMINE (and the shorthand, EXA) is absolutely necessary.

PUT is absolutely necessary. SEARCH is absolutely necessary.

I'm probably forgeting several commands, but you get the general idea. :)

If you have any questions, comments, suggestions, inquirements or otherwise, please
send me electronic mail via:

dunric@yahoo.com

If ADVENTURE could be crammed into 16K, then I don't see why WFPC can't either.

Regards,

Paul
dunric@yahoo.com

Yes, take a look at http://www.asamnet.de/~hilgarte/. This is a
ethernet-solution for all Ataris with ROM-ports, that includes both
your ST and Falcon. You can install STiNG and use ftp to transfer stuff
between your Atari (or Ataris if you buy two) and PC, and even go
online if you install some sort of ip-masquerading on your PC (e.g.
Wingate).

> 2) I've been getting conflicting reports about SVGA compatibility.
Do I
> just need an adapter, and then I can use all Falcon resolutions on a
SVGA
> monitor?

Get an adapter (it's usually included, all "serious" users use VGA) and
that's it. Some of the low-frequency (15Khz horisontal) resolutions are
not available, and you can't use 16-bit resolutions for anything but
that is no loss unless you want to watch demos all day.

> it could happen!) What ever happened to the PC emulators for the
Falcon?

Definitely not. The only emulator available has a 286 CPU...

> ports.

The LAN-port is a RS422-port, a serial-port similar to RS232 except
that it's electrically balanced (which - in theory - means that it can
handle higher speed and longer wires). On the Falcon it can't handle
more than 230kb/s, not very high-speed at all...

On the Mac this port was used to connect to a bus via tranceivers, I
haven't seen similar solutions for the Falcon and TT.

a plea to all those who remember Elite and Frontier Elite II. David Braben(may he live forever) has created the Elite club which will allow for free use of the games (visit www.eliteclub.co.uk or www.frontier.co.uk for more details.) Anyway after speaking to several people on the project over alt.fan.elite if we could find somebody who would be willing to transfer the source code from PC to Atari for the more modern versions of Elite (Frontier First Encounters) then this would be fine. Anybody like to talk to me about this...please.

> strong, while my PC is killing itself.

Similar here. The 800XL, 1040ST and Falcon all run without problems
for >= 7 years. The first part of the PC I had to replace after
2 month !

> 2) I've been getting conflicting reports about SVGA compatibility. Do I
> just need an adapter, and then I can use all Falcon resolutions on a SVGA
> monitor?

With SVGA adapter and monitor you can display all ST and Falcon
resolutions. Maybe you got confused because with an ST you can't
use ST low resolution on a SVGA monitor but with a Falcon you
definitely can. I did it quite frequently over the last 7 years.

> 3) One reason I want to remain on an Atari is the "retro" sounds it can
> produce. I'm assuming I can reproduce this on modern equipment, but the
> older stuff still has a nicer tone to it. (Don't ask, I have strange
> tastes... ;)) Does the Falcon still retain the older style of voice, such
> as the original ST? (or, at least the capability... am I making any sense
> here?)

I like my Falcon as much as my other Ataris (even more in fact).
It has the same feeling, only more possibilities. BTW I don't use
its AD converters but JAM IN and JAM clock for recording because
of the superior quality of the LINE AUDIO products.

> 4) Drive capacity. What is the max drive size / partition size supported?
> I remember seeing 2gigs listed for *some* computer, but it might've been an
> *cough* amiga *cough*

For TOS partitions it's 1 GB, which is more than enough for a CD
image and therefore sufficient for me. Drive (usable) size, at
least for IDE is limited to 8 GB, unless you have a recent version
of HDDRIVER where the limit is much higher. I use a 20 GB IDE HD
with no problems.

> 5) Hardware emulation. Do they make a Falcon-on-a-board for the PC? (hey,
> it could happen!) What ever happened to the PC emulators for the Falcon?
> Where they ever any good? Could I kill two birds with one stone in this
> manner?

Unfortunately not. The one board I know of only has a 286 CPU on
it and therefore is of no practical use. That's why I had to buy
a PC too.

> Thats why I like Ataris: the
> people are actually proud to own one.

I at least surely am.

Hi

I don't seem to have any problem with the one I have, I've never had flicker problems and I find it easier on the eyes than my 125 or 124!

Maybe it's had some work done on it!!

If you are talking anything but RAM chips, I know of a company that will
produce custom gate arrays to replace out-of-production chips...that is
if an acceptable contract arrangement can be reached. If Milan will have
a large production run, they probably can afford to have the chips made.

If you can get someone with Milan to email me, I can put them in touch
with the right people...

This is how I remember it, too. Didnt want to use too much space here tho. I
too have an Amiga 2000(actually 7 Atari's, 2 Mac's, 5 Pentium class or
higher PC's), and I still prefer my Falcon. The Amiga is great for games,
but dosent do anything I can't do on a Mega. But enough bashing as long as
it aint got Windows, it has to be at least half allright:-).

Hi Ken

There are Atari programs that convert IMG files to GIF or JPG so they can be shared more universally. There are members of Atari-Midi Egrp that would be interested. We could even put it up on our FILE section for everyone (including the public at large) to use.

If you do not have the program to convert it,you can send the file to me personally, and i will be happy to convert it.See sig

You could even JOIN US at Atari-midi. Could use your input!

Tim

I would like to invite anyone of you to the Atari-midi mailing list.

Amiga got their start making joysticks, and the foot-operated 'Joyboard' for the VCS. Their staff included Jay Miner, who had crerated the video chips for the VCS, and 400/800 computers. You can see this in the similarities between the Antic chip in the Atari 8-bits, and the Amiga main video chip, with its' sprites, & dual playfields, and programmable graphic modes.

Amiga had developed the computer with help of a loan from Atari, while Atari was completely owned by Warner. The loan came with the provision that Atari had the option of buying the Amiga computer when it was finished.

Atari only wanted the chipset, not hte whole computer, or its' OS. Amiga sold out to CBM, and paid off the Atari loan.

CBMs' chief engineer, Shiras Chivi (SP?) was rumored to have started designing the ST while at CBM, before joining Jack Tramiel at Atari. This was never proved, tho CBM sued Jack & his CBM defectors for stealing corprate secrets. The new Atari counter-sued, and nothing was ever proved against either side.

Atari released the ST 6 months after Jack bought it from Warner. CBM released the Amiga 1000 soon after. The STs' strength was that it was a great computer, and only cost about $800.00 U.S., while the admitidly graphically & sonically superior A1000, cost $1295.00 .

Atari held this price / performance lead til about a year after CBM released the A500. The ST game developers started seeing there was more profit in the Amiga side, and stopped offering ST versions of all their games. The A500 became the hot game-playing computer, and stole the lead from Atari permanently.

The ST became known for its DTP capability, and really shone there, as well as always being the premiere MIDI platform.

I have a 1040 ST, Falcon, & Amiga 500. I prefer the Ataris' for most tasks. I find them much friendlier and comfortable to use. I enjoy using Deluxe Paint on the A500, doing effects I can't do on the ST.

Someone here said the Amiga has the better specs, and I agree. What really matters is what you want to do with your computer, and how much you enjoy doing it on that system. I'll never stop using my Ataris. I did lotss of WP on the ST, and now 3D graphics with Cyber Sculpt, & Lexicor Phoenix Render on the Falcon. And lots of games on both.

My used A500 came with DP before I got any Falcon paint SW, so I haven't used any on it except for Lexicor Prism Paint, which doesn't have SFX. I

did enjoy PP, but missed having functions like painting with chalk, etc., that I'd been seeing in ST Format reviews of Falcon SW. I'll have to check out the demos I have of some Falcon paint SW, like Truepaint.

This is my first posting to an international
Atari newsgroup, and I apologize for the length. I just had to comment on this issue.

To sum up, I love both Ataris' & Amigas', and both have their place. Aren't all of you in either camp glad you had the choice? I'm glad to have both to play with. The fact that they're different machines, with differences in their design, software, and OS - are very exciting.

And I enjoy the people in both groups, too!

Regards to all,

Gary F. / dx285@ncf.ca / Ottawa, ON.

The Falcon has everything the ST and STE has - including the old YM-
chip and the 8-bit stereosound - in addition to it's 16-bit 8-track DMA-
sound.

> As for harddisk size, I don't really know. I tried a 9GB SCSI, but it

SCSI
> wide) without any problems. Maybe someone has some more info?

I don't think there are any limits at all, although if you only want to
run TOS you can only have 14 partitions with max 1Gb each (or is it
2Gb?) so TOS is the limit here. If you use MiNT or MagiC with FAT32 or
ext2fs you can use just about any drive available today.

However, since CAF doesn't use the filesystem but has it's own, there
may be other limits that I don't know about.

Hi

I can only speak on UK prices, you didn't say in which country you are
from as some countries it's hard to get ST gear!

At the moment the STE's are expensive as everyone seem to want them.
Other ST model's ST/STF/STM/STFM are dead cheap especially the half meg
ones, due to the cost of upgrading the memory.

Hard drive wise, the Atari ones (20/30/60... meg) are fetching silly
money, so I'm wondering if they are fetching Collector status!

You are better off buying a SCSI adaptor such as the Link, Link II, Link
97, Top Link etc. this will allow you to use virtually ANY external SCSI
device including: CD-ROM, MO Drives, EZ, Zip etc...

These vary in price, the cheapest I've ever seen is ï¿½20 up to a rip off
ï¿½90 (second-hand).

PC cards SHOULD be dead cheap, but were VERY expensive only a couple of
years ago. There were 286, 386 and I think maybe a 486 board! For less
than ï¿½100 you should be able to pick up a reasonable 486, even a
Pentium.

Hi

On the pc side there are lots of utilities that will produce effects
with ease, and better than their page.

When it comes to schools, it's not necessarily the pupils in the school
but how RICH the school itself is. They may be able to afford, or have
donated, decent software packages to aid them.

The intro itself is a FLASH intro, I didn't see anything to give the
option to skip the intro. Which is sad, as web sites are meant to be
viewable on any machine format.

Sorry, Flash is a wonderful technology (small files, nice effects,
scalable) but it's not available for the Atari. You can of course
create an animated GIF file.

> If the answer is as I expect, then it puts in focus how far we are
> behind in Web technology with the Atari.

You can compare the currently most powerful Atari browser (Draconis)
with Netscape 3.0 minus Java and plugins. The problem with Flash is
that Macromedia didn't publish the plugin source code for a long time.
There are now some open source programs supporting Flash but I don't
know how far they are with their efforts.

I'd say that open technologies such as HTML4, XML, CSS etc. will come
to the Atari sooner or later. And there's already a new vector graphics
format in development (SVG) which can be used together with JavaScript
for some nice effects.

Greetings,
Matthias.

yes of course I take your point, and there is always the 'must fill a
bigger bucket' syndrome even if everyones thirst can be sated by a smaller
one, but on the basic ability of rapid loading of images, is not CAB found
wanting?

Yes the web is a wonderful tool for imparting information and a measure of
the language of that tool must be it's speed of translation. CAB is not, surely

a rapid translator, even of HTML in its most basic syntax.

Hi,

Wouldn't it be nice if we could get hold of the sourcecode for the Atari version of Elite II? Update it with DMA sound, DSP fx, gouraudshading, higher resolution etc etc?

Regards

/Peter

I suspect on our platform it's not the software that's at fault (CAB)
but the lack of sheer processing power. On a modern PC, display of a
JPG is instant but I have yet to find *any* Atari program that can do
it at that speed, even with the help of the Falcon DSP.

CAB can be quite fast at translating HTML, but is incredibly slow at
displaying images and also drawing vector fonts, but then again so is
Papyrus and all other programs. Font drawing is passed to NVDI anyhow
(for example). You only have to look at the speed of a program such
as ST Guide which is a hypertext system similar to HTML, but uses
ordinary system fonts. Papyrus Office has abandoned ST Guide in
favour of providing normal Papyrus documents for its help files, but
in doing so has rendered the facility very tedious.

Eagerly awaiting Titan's Tempest!

There has to be a point I suppose where we give in and say that, OK,
the Atari platform is not up to this sort of thing, i.e. images and
vector fonts. But things such as Flash and Javascript are another
level again which takes HTML beyond what it was intended for.

I'd be interested to know how CAB performs on a Milan or Hades.

Hi again,

I've just looked at the page with with my system, which dare I say it must be near the top end of the atari ladder, V90/115200, CAB2.8, Milan I and oh dear!!

A blank intro page, except for the 'skip intro' button at the top right, then a simple menu page etc. The pages with rapidly loading graphics on my PC, load painfully slowly and generally I take the point that this form of HTML or whatever does not allow the receiver at least this receiver to get information quickly. Trouble is we can hardly say 'please, all you web page designers out there, will you only use basic code as our platform can't keep up', and not expect a big V-sign.

Bob King.

I hope they have just given us all the wrong impression then, as I
would like to see the machine released. I do recall they
held a live IRC chat once or twice but that has not happened
in a long time, back in the day of the Milan1.

Yep, that's my whole point really. As in my last email, it's our problem that our platform can't handle basic things like images and vector fonts, but when designers build in features that depart from such things it would be nice to build an 'escape' route in. It's only poilteness and courteous after all.

Designers that stick to HTML principles will have the last laugh when web access via TVs, mobile phones (and the oft-quoted toasters) becomes the norm and their sites will display perfectly on those devices.

'Graceful Degradation' is an integral part of HTML. Fine, build in bells and whistles if you want. But also leave the site accessible to those unfortunates who have nothing more than a fully-compliant HTML browser.

Hi Chris,

complete downwards compatibilty is what you want!!! and see the problems in
the real world of gimmy gimmy that the same generous aim caused the PC, the
Mac and the Atari. Nice idea but in the end unrealistic.

Bob

Is there a program (possibly accessory) that prevent the ST's habit of dropping the menus when the mouse rolls over them. Something similar to the Mac where you need to press the mouse button to drop the menu down?

Thanks...

3652. Priority framing...

Newsgroup: comp.sys.atari.st
Date: 2000-10-06 00:00:00 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.1001006232255.28879B-100000@halifax.chebucto.ns.ca>
Source record: 56565

Is there a program (possibly accessory) the forces whatever frame (box) the mouse rolls over to become the highlighted frame? Moving folders from background frames won't work until that frame becomes the main highlighted frame and so you need to click on the background frame to bring it forward prior to moving the folder. I wonder if there is a program that would automatically do this. I thought I read somewhere it was possible.

Thanks...

3653. Midi Player...

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs for NEW Atari stuff!!

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So check out what's new on my Web
Site. I have 8 different Catalogs, & my SoftWare Catalogs are largest.
They have the biggest Byte Count. Boy! You should see my inventory! I
have Libraries of Books and Reference Material, TruckLoads of HardWare
and Crates and Crates of Software for the Classic Atari 8 Bit, Atari 64
Bit Jaguar Game Machine and the Atari ST and Newer Computer Line!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want to order and E-Mail me the rest of what you do want to order! To
expedite things, include your complete Mailing address so I can figure
Shipping/Postage and Handling. I'll be back after the weekend.

And remember, if you can't come see me today, come see me tomorrow! :-)

Please Direct all Replies Through E-Mail to: bensmith@teleport.com or
atari@benjamin.net. If you cant reach me at benjamin.net see my E-Mail/
Web info in my Signature attached to the bottom of any of my messages!

Wanted: Mega ST4. Willing to pay up to $100 U.S. Read on if interested!

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

I tracked down the binary and the source code from my hard drive. It can
now be found on the STiK2 site on the secondary applications page.
Just look for the tag Listport.

It looks very impressive, I would probably buy one when/if available, especially now that it looks like the MilanII won't show up. I still won't pay in advance though, after all this is not the new Ferrari and I'm no millionaire...

> The web site has been updated :
> - two new paragraphs you should read about the OVERCLOCKING and the FITTING.
> - a new technical menu with an Architecture Block Diagram !

It's very impressive, I have a few comments and questions though:

1. You suggest that existing expansion-cards can be used by fitting a through-socket on top of them. This is not a good idea with the Nova and Eclipse (I have both), since this will conflict with the ribbon cables to the ISA/PCI-cards. It's better to fit a through-port on top of the CT60 (either by default or by the user) and use ribbon cables or spacers if necessary.

2. How do you solve the problem with TOS being 040/060 incompatible? Do you have a loader in flash which loads and patches the original TOS in fast-RAM (like on the AB, except that it's loader is on disk), or do you have a complete, patched TOS in flash?

3. I like the fact that you don't try to speed the Falcon itself like you did with the CT2 :-) I also like that you don't fill it up with features (like USB and SCSI), but I'd like to see an IDE-port. It's a very simple design and should be quite a lot faster than going though the Falcon-bus like today.

4. I see that you don't use the PMMU to remap the fastRAM (good!),but you probably need the PMMU to disable caching of hardware and DMA-buffers. It would be a good idea to use the same method as the AB if possible, as this will keep MiNT happy and memory-protection will still work.

5. What's up with the DSP? On my Falcon/AB, I have speeded the DSP to 50MHz (http://atari.nvg.org/dsp/) and it works perfectly with or without the AB, no patches needed. Have you come up with something that speeds it up even more? If so, I'd rather keep it simple and 100% compatible than having to rely on software-patches. After all, the DSP is of little use when the CPU is several times faster...

Bingley Hall is in the Staffordshire Showground.....Staffordshire, England.
(for overseas readers)

You can use either Exit 13 from the south or 14 from the north, there should be signs to guide you, there has been in the past.

Keychange Music will be present with supplies for the musician, Cubase v3, Midex, Unitors etc.

We may run a draw for the chance to 'brick' a viewtek monitor, unless someone wants to buy it, or them, we have three to get rid of, 'orrible b****y things.

Barrie at Keychange.

The one I read on comp.sys.cbm went like this:

Atari gave Amiga an R&D loan. Should Amiga have been unable to pay said
loan, Atari would seize the technology (the loan was garaunteed against
it). Commodore bought out Amiga immediately before the loan period
expired, and Atari's loan repaid, leaving Commodore to market the Amiga.

Hi all

continuing on my theme of inappropriate use of this News Group, formed,
I assume for cross fertilization of information about the Atari, it
seems sad that a very prominent and respected member of the Mint
community, should use this NG for a 'name and shame' diatribe,
particularly when the argument is purely between herself and the other
party and that, ironically, she is guilty of exactly the 'crime' she
alleges, namely the unnecessary cross posting and the failure to carry
out a simple deletion of this NG as a recipient.

I certainly have no voyeuristic, interest in the personal arguments of
others unless it has a fall out effect of increasing the font of
knowledge pertaining to Atari.

Bob King.

I have bought the adapter from AG in order to have a PAM VME network
adaptor working along with a graphics card, but had no success. I had
tried PAM with Crazy Dots II, Nova VME and Matrix CoCo. The graphics
cards booted up with this configuration, but the PAM adaptor refused
to work. Maybe there is an address conflict - both cards claiming for
the same address...

BTW: You don't need a tower, the VME-doubler will fit into the
original TT case.

Do you think I can access a mac printer with this port?
Or is it possible to connect a mac with a falcon by normal terminals?

If I start Connect and switch to LAN port I don't have to connect
anything. It shows strange signs when I type on the keyboard.
Echo is off... but...

That would explain the differences between the Sweet Sixteen type
systems (my memory is fuzzy, but Atari History has details of an in-
house 16-bit Atari XL type system), the ST and the Amiga - if Atari
hadn't planned to release the Lorraine themselves.

Sounds pretty dumb to me, though, and quite a sneaky bit of Tramielism -
why buy the technology, when you can (presumably) force someone to go
bankrupt then seize the technology anyway.

I prefer the Apple IIgs, but of the Amiga and ST, I like the ST better
if only because Workbench is so weird!

Source record: 56631

I did a little happier than expected this month - so I've got ï¿½150 going
spare for a MegaSTE or TT/030 (or a Falcon, in unmodified form with an
HD).

Looking for internal SCSI HD of >250Mb. Software isn't important, as
long as any original Atari stuff (manuals and such) is included.

Monitor is unimportant, as long as it has more than 4Mb (2Mb is
acceptable in a MegaSTE if my STE RAM will fit) and a 1.44Mb floppy,
I'll be happy.

If it has SCSI, I may have an ICDLink2 for sale or part trade.

Be quick though! I might spend it on something else in the meantime...

3674. Web page design with atari?

Newsgroup: comp.sys.atari.st
Date: 2000-10-06 00:00:00 UTC
From: Bob King <robert.king@patent.gov.uk>
Message-ID: <39DDDBC0.60C67F24@patent.gov.uk>
Source record: 56632

Hi all,

My big boss, The Assistant Comptroller of Patents, was one of the judges at a competition run by the Engineering and Physical Sciences Research Council for the best Web Page Design by UK schools. 250 schools took part. I could not view the winner as I do not have the plug-in, but please look at the runner up at:

http://www.epsrc-sciencerace.net/schools/534121/

My question is: is there any Wizard etc software or even combination of software on the atari complatform that could do anything remotely like this. If the answer is as I expect, then it puts in focus how far we are behind in Web technology with the Atari.

Bob King

Hi Bob. I haven't tried with my atari yet, but if you click on the "skip intro" button you can probably see the pages, as id doesn't appear to contain alot of JS or java. The pages are nice in contents, and easy to navigate, including the consideration of giving the visitor the option of skipping the Flashy introduction. For creating the pages you can use any of the wizzards for atari such as :
Webpage Penguin (check on the M.U.C.S page)
Expresso (form OXO)
Web Wizzard (Cadenza)

For the introduction that is a Flash macromedia thing, there is no plugin nor wizzard AFAIK, but if someone is really into it, the viewer has the sourcecode (C++) and the file format freely available in the macromedia site. Even from my ignorant point of view is surely not an easy task to port it, but not impossible (any skilled programmer out there?).

Yep! we are behind :(

Saludos!

Daniel

That sucks... I'd rather have good graphics than fast ethernet, so if I
can't get the Pam's or Riebl to work with the Crazy Dots I'll probably
sell the ethernet card and use Elmar Hilgart's pocketLAN-adapter instead.

Hi Daniel,

I'm viewing it on my PC with Netscape, so I have no idea if CAB 2.8 my browser can see the Flash. I very much doubt it. This web page was put together by a team of school children, albeit with the aid of a teacher. Ye gods, it sure puts yours truly in his place, struggling with basic HTML. The images on all the pages come up very quickly, its a model for most others.

Carl

Dont know what part of the World you are in but I recently (last
week in fact) bought most of the items at the prices noted(the
price is quoted in Pounds Sterling) from a car boot sale.

1040 ST - £7.50 inclusive of mouse,joystick,manuals and
a lot of software (games and serious stuff).
30MB harddrive
520 STE - £3 (1040 in fact) with View Tech Monitor
124 Monitor
Hardware PC card

Hope this gives you an idea.

But is that a bad thing??

The whole point of the web is that it is accessible to everyone
regardless of what platform they use, what hardware spec they have and
even what type of device they view it on.

What *is* "Web Page Design"? Is it a case of making something look
nice, or making something usable and useful?

Stick to the guidelines of HTML and we have everything on the Atari
platform that allows the development of good web sites. It requires
skill, talent, imagination and flair to make a site look good AND
useful. That's what it's all about, rather than the ability to use
tools such as Flash which rely on a certain spec of machine on the
client.

I'm also an advocate of server-side processing, as opposed to client-side.

Hi Ken

You do not need Flash=II. It will simply be a GIF file after conversion
that will be available in our PICS folder on Atari-Midi File Section.
The File section is open to the public, so anybody can use it. You can
go to my page and click on "Atari-Midi File Section."

Hi,

Is there anybody who has used gprof successfully ? I set the -pg
option at GCC, the function main of my C program terminates with
'return 0' but after running my programm I don't find a gmon.out
(nor any other new file). What else can be wrong ?

Another question is whether anyone could point me to some infos
related to 68030 asm optimization. I already have the original doc
from Motorola and a several years old file about optimization
written by artTBL. Any other doc where I could get new ideas ?

And finally, is there somebody willing to share his/her Falcon
256 color mode asm sprite routines ?

Thanks
Gerhard

I donï¿½t know.
Using apple talk to inbound an atari was a fine idea.
Need software drivers and an software author.
Canï¿½t say anything about MiNT.

There is a samll one called SMF-Play.prg which should do the trick. I have
it and it works fine on my Hades/STe. I also use Sweet-16 which is more
than just a MIDI file player. It lets you change things to your liking.

>(for overseas readers)

> Why is every one's just saying November for the Staffs show, what bloody day????
> is it some kind of national secret?

Saturday, November 11th, 2000.

If anyone has any particular requirements Atari wise let me know and I'll try to bring them to the show.

Current stock includes Unitor, Midex+, SM 144, SM124, Mega ST and Mega STE, Megafile 30 and 60, dead Steinberg SMP 19, 'rare disdriveless Atari ST'.....maybe one of my TTs, various STFM 1/2mb boards, all working, use them to upgrade your old 'orrible TOS 1.0 STFs, (honest, there are hundreds of these solid old sods still running Cubase). SCSI hard drives, Emagic Notator and Notator Logic. Cubase Falcon Audio 2.06
Genuine brand new Cubase v3.1 packages, of course.

Enough for now.

>We may run a draw for the chance to 'brick' a viewtek monitor, unless
>someone wants to buy it, or them, we have three to get rid of, 'orrible
>b****y things.

> >If "bricking" involves throwing bricks at the cathode ray tube, count me out.

That's the idea......

> >Is this caution uncalled for?

Yes, if the monitor is powered off and is in some kind of container, e.g. a skip. The bits don't fly too far. (joke)
Nine years of fettling Ataris gives one a different sense of humour but I really do dislike the viewtek, although opticians must be a lot richer because of it.

This is my opinion of course.

Tongue in cheek time again.

Barrie at Keychange.

>donated, decent software packages to aid them.

Bollocks. It's not a matter of having rich kids, it's a matter of having smart kids who know their HTML. All you need is a text editor and an image processing program, both of which are very much freely available on the very same web.

>The intro itself is a FLASH intro, I didn't see anything to give the

Hi Tony,

There are several, I have sent one called 'SafeMenu'. Here's an extract from the read.me file:

'Select Safemenu's panel in XCONTROL to configure menu behaviour and mouse speed:

Normal: Menus behave like they would without Safemenu.

Pulldown: Menus behave like on an Apple Macintosh. To select a menu item, click on the menu title and move to the item while keeping the mouse buttong pressed. Release the mouse button to select the item.

Right button: The mouse pointer can only be moved into the menu bar when the right mouse button is pressed.

Half menu: A menu drops down only when the mouse pointer touches the upper half of the menu title.'

Hope it pleases

Bob King

Hi Tony,

Me again, the correct prog. is called 'Mauswind'. Here's an extract from the readme file:

When Maus-Window is active and the mouse-cursor resides over a non-active window, the window will automatically be topped. This is achieved by simulating a mouse-click using the AES-call appl_tplay(). This confors to GEM and causes no problems with "clean" applications (see section 4 for a description of problematic programs).

I'll send,

Bob King

3707. Atari 520 ST fm for sale

Date: 2000-10-07 00:00:00 UTC
From: Russell Gurney <Rgurney@tesco.net>
Message-ID: <8rnk99$q4i$1@epos.tesco.net>
Source record: 56512

I have an old atari 520 st fm for sale with matrix dot printer, mouse, joystick & lots of software. The single 'a' drive which is not working. Anyone interested in it please e-mail me back before the end of next week. I'll take a fiver for it for the lot or it goes down the tip. Location: southern England. Rgurney@tesco.net

3708. AES with an AlberTT

Newsgroup: comp.sys.atari.st
Date: 2000-10-07 00:00:00 UTC
From: jba4@po.cwru.edu
Message-ID: <39df5d9e.4042105@news.cwru.edu>
Source record: 56513

Hey everyone! I was thinking about upgrading from MultiTOS to a
better AES. The only problem is that my TT has an AlberTT card from
Dover Research. Has anyone successfully used Geneva or N.AES with
this card? I'd really like to insure that it'll work before I
pruchase. Furthermore, has anyone had luck with MagiC 6 with this
graphics card (I know this is not an AES, but a different OS)? I dn't
think Magic 5 wver worked with it.

Anyway, if anyone has seen NAES run with an AlberTT card, where is a
reliable place to purchase this?

Thanks in advance, everyone!

3710. Multi-media CD

Newsgroup: comp.sys.atari.st
Date: 2000-10-07 00:00:00 UTC
From: rking@zetnet.co.uk
Message-ID: <39df6387$0$1658@news.zetnet.co.uk>
Source record: 56515

Hi all,

having just finished making a 10 track Audio CD for my son, he now wants a multi-media CD. Looking at the contents of various PC CDs, I think I have all the means to make the individual items (except for a sound AVI!!), but appart from linking everything in HTML, I can't find anything as a 'front end driver'. For the PC these seem to be either purpose written for the PC CD or from PC specific programs. Am I right in that either he should buy a PC, or hire a professional to do it be content to keep it simple and use HTML or give up the idea. He wants the CD to basically promote his music.

Thanks in advance.

Bob King.

>to work. Maybe there is an address conflict - both cards claiming for
>the same address...

I don't think that there is an address conflict. Me too has bought an
adapter from AG. Tonight I have installed a newer version of the adapter.
My main goal was in the first place to get my Crazy Dots II card working
again so for the test I only inserted the Crazy Dots II card.
I got some video signals but they were completely wrong. The screen was
blueish with every two cm a small vertical stripe. At the end of the
bootprocess I got two bombs and that was that. No way I could boot up.
Is it possible that the cables of the adapter are just too long?
I did install the orinal VME card again and with this the Crazy Dots works
without any problem.

Atari Computing ceased publication a long while ago. Their web site
was therefore no longer needed, and was presumably closed after a
decent interval.

There is no (AFAIK) overall "authority" overseeing any Atari presence
at the show, however I'm led to believe that forces behind the scenes
have negotiated lower rates for the hire of stands to help out any
Atari presence.

>complete downwards compatibilty is what you want!!! and see the problems in
>the real world of gimmy gimmy that the same generous aim caused the PC, the
>Mac and the Atari. Nice idea but in the end unrealistic.

Nah, not really! As I mentioned, web via the TV is just around the corner
and a lot of sites simply won't work on the TV. *That* is being
realistic. This does not imply
'downward compatibility' to get them to work. HTML has been built with cross-
platform compatibility in mind - read the W3C definition of HTML. Things
such as Flash and IE/Netscape extensions are produced by companies who want
to make sure *their* products are used by everyone, they're not interested
in cross-platform compatibility as it's obviously not in their interests.

You think that sites have to be 'downward' compatible to Atari machines??
That implies that somehow an Atari is inferior to a PC! In many ways, CAB is
actually superior to IE and Netscape. It doesn't have any extensions of its
own therefore if you design a site so that it runs OK in CAB you can be almost
certain it will work with every other browser. Also, if you go to any page on
my site, you will find CAB displays a little signpost or double-headed arrow
in the toolbar. Click on it and up pops a navigation window, allowing you to
go to the next or previous page, the contents page, and even email the author (me!).
This means that theoretically you don't need to clutter your web page with
navigation aids. The browser could also pre-load the next pages in the sequence
to save download time, as it knows what the next pages are. This clever feature
is provided through the use of standard HTML, however if other browsers recognise
these elements then they don't make it obvious. I have to provide navigation
aids on my pages so that they are downward compatible with other browsers that are
not fully HTML-compliant!!

Why do you have to make your site downward compatible with a speech browser or a
text-only browser? Are they inferior to a graphical browser? If you write your page
according to HTML specifications and guidelines, they will work with *any* browser
regardless of their capabilities - simple things like putting sensible ALT tags
in images, and knowing when *not* to put ALT tags in images.

And in the end, what does Flash offer? How does the use of Flash improve a page
to make it more usable and useful? As I can see it only serves to increase
download times and encourages people to hit the Stop button and not progress
any further with your site.

If the purpose of the web is to provide graphic intensive, artistic miracles then
maybe Flash is the right tool. If, however, it's to publish *information* to as
wide an audience as possible, then we should steer clear of tools like Flash.

Perhaps if you compare to most RS-232 implementations (like found on most
PC's), but even RS-232 can do a lot higher speeds than 230kb/s.

>>On the Mac this port was used to connect to a bus via tranceivers, I

That's true, they're not much more than that. They are buffered though
(IIRC, it's a long time since I used one of those), but nothing more.

I don't think that's correct. "Mac"-printers like the ones Epson made, are
nothing but ordinary printers with a serial port, so you can use these
with NVDI and a proper cable. I don't know about Apple's printers.

>> Or is it possible to connect a mac with a falcon by normal terminals?

SLIP or PPP will probably work.

Aren't the ST components cheap junk?

>(trust me, after a full size PC case, almost anything else is portable...).

There are smaller cases, too. I've got this 486 motherboard with PCI which
could very well fit into any SCSI box.

>1) Is there a LAN adapter for the Falcon? I remember someone working on one

There is a LAN adapter, using a parallell Ethernet adapter and an interface to
the cartridge port for supplying extra signals. Only 10 MBps, though.
URL: http://www.asamnet.de/~hilgarte/

Amigas may run anything upto several terabytes. ^_^
With the right HD drivers, there should be no limitations on the Atari,
either.

>5) Hardware emulation. Do they make a Falcon-on-a-board for the PC? (hey,
>it could happen!) What ever happened to the PC emulators for the Falcon?

There was supposed to come a 386 emulator, but I doubt it ever surfaced. There are software 286 emulators, but these are of little use today.

3731. Translator One power supply -- info?

Newsgroup: comp.sys.atari.st
Date: 2000-10-07 04:06:31 UTC
From: David Zinkin <dzinkin2@rochester.rr.com>
Message-ID: <dzinkin2-A62FC2.00102707102000@news-server.rochester.rr.com>
Source record: 56577

Thanks to all who responded to my earlier request for Magic Sac software. Thanks to Tim Conrardy, I now have not only the parts to the Magic Sac, but most of a Translator One as well.

To anyone else who has a Translator: could you please tell me what kind of power supply (voltage, amps, etc.) it uses? It appears to be a standard connector, but the other relevant information seems to be absent from the manual and from the Translator itself.

Thanks again!

If "bricking" involves throwing bricks at the catode ray tube, count me out.
I've been told that one should be very careful when handling CRTs; not only
due to the extremely high currents involved, but also due to the risk of
implosion.
Is this caution uncalled for?

>On any mac, not on atari.

True, but a LAN doesn't have to be Ethernet. OTOH, without any real routines
for LAN port networking on the TT/Falcon, it would have to be a point-to-point
network using STiNG or something like that. It would be rather interesting if
someone write a STING driver which used the LAN port along with Localtalk
